Francesco Marini (Milano)

Ricardo A. Broglia (Milano)

Kyoto, October 24th, 2011

Introduction and Outline

This talk will be devoted to **two particle transfer reactions** as the specific probe to study **pairing correlations**. Emphasis will be made in the connection between **structure aspects** and the resulting **two particle transfer cross sections**.

Outline:

- Reaction mechanism : two particle transfer in **second order DWBA**
- $^A\text{Sn}(p, t)^{A-2}\text{Sn}$ reactions: transition between **pairing vibrational** (closed shell) to **pairing rotational** (superfluid) regimes in the **tin isotopic chain**.

Two nucleon transfer reactions

- Two valence nucleons go from core b of nucleus a to core A of nucleus B
 - Probing **two particle correlations**.
 - Investigating structure properties such as **pairing** and **superfluidity** in a finite fermion system (the atomic nucleus).
- Get **absolute values** as well as the angular distribution for the cross sections in **second order DWBA**.

$A(a, b)B$

Examples:

$^{112}\text{Sn}(p, t)^{110}\text{Sn}$

$^1\text{H}(^{11}\text{Li}, ^9\text{Li})^3\text{H}$

Reaction mechanism:
second order DWBA

Elements of the calculation

$\Psi_a(\vec{r}_1, \vec{r}_2)$, $\Psi_B(\vec{r}_1, \vec{r}_2)$: **internal wave functions** of the transferred nucleons in each nucleus

$\chi(R)$: **distorted wave** describing the relative motion in the optical potential $U(R) = V(R) + iW(R) \left(\frac{P_R^2}{2\mu} + U(R) \right) \chi(R) = E_{CM}\chi(R)$

V_A, V_a : **mean field potentials** of the two nuclei

Elements of the calculation

$\Psi_a(\vec{r}_1, \vec{r}_2)$, $\Psi_B(\vec{r}_1, \vec{r}_2)$: **internal wave functions** of the transferred nucleons in each nucleus

$\chi(R)$: **distorted wave** describing the relative motion in the optical potential $U(R) = V(R) + iW(R) \left(\frac{P_R^2}{2\mu} + U(R) \right) \chi(R) = E_{CM}\chi(R)$

V_A, V_a : **mean field potentials** of the two nuclei

V_A (V_a) is the **interaction potential** that transfers the nucleons from one nucleus to the other in the **prior (post)** representation

Elements of the calculation

$\Psi_a(\vec{r}_1, \vec{r}_2)$, $\Psi_B(\vec{r}_1, \vec{r}_2)$: **internal wave functions** of the transferred nucleons in each nucleus

$\chi(R)$: **distorted wave** describing the relative motion in the optical potential $U(R) = V(R) + iW(R) \left(\frac{P_R^2}{2\mu} + U(R) \right) \chi(R) = E_{CM}\chi(R)$

V_A, V_a : **mean field potentials** of the two nuclei

V_A (V_a) is the **interaction potential** that transfers the nucleons from one nucleus to the other in the **prior (post)** representation

it is a **single particle potential!!**

Simultaneous and Successive contributions

$$|\alpha\rangle = \phi_a(\xi_b, \mathbf{r}_1, \mathbf{r}_2) \times$$

$$\phi_A(\xi_A) \chi_{aA}(\mathbf{r}_{aA})$$

$$|\beta\rangle = \phi_b(\xi_b) \phi_B(\xi_A, \mathbf{r}_1, \mathbf{r}_2) \times$$

Two particle transfer in second order DWBA

Some details of the calculation of the differential cross section for two-nucleon transfer reactions

$$T_{2NT} = \sum_{j_f j_i} B_{j_f} B_{j_i} \left(T^{(1)}(j_i, j_f) + T_{succ}^{(2)}(j_i, j_f) - T_{NO}^{(2)}(j_i, j_f) \right)$$

$$\frac{d\sigma}{d\Omega} = \frac{\mu_i \mu_f}{(4\pi \hbar^2)^2} \frac{k_f}{k_i} |T_{2NT}|^2$$

Simultaneous transfer

$$T^{(1)}(j_i, j_f) = 2 \sum_{\sigma_1 \sigma_2} \int d\mathbf{r}_{fF} d\mathbf{r}_{b1} d\mathbf{r}_{A2} [\Psi^{j_f}(\mathbf{r}_{A1}, \sigma_1) \Psi^{j_f}(\mathbf{r}_{A2}, \sigma_2)]_0^{0*} \chi_{bB}^{(-)*}(\mathbf{r}_{bB}) \\ \times v(\mathbf{r}_{b1}) [\Psi^{j_i}(\mathbf{r}_{b1}, \sigma_1) \Psi^{j_i}(\mathbf{r}_{b2}, \sigma_2)]_{\mu}^{\Lambda} \chi_{aA}^{(+)}(\mathbf{r}_{aA})$$

Two particle transfer in second order DWBA

Some details of the calculation of the differential cross section for two-nucleon transfer reactions

$$T_{2NT} = \sum_{j_f j_i} B_{j_f} B_{j_i} \left(T^{(1)}(j_i, j_f) + T_{succ}^{(2)}(j_i, j_f) - T_{NO}^{(2)}(j_i, j_f) \right)$$

Successive transfer

$$T_{succ}^{(2)}(j_i, j_f) = 2 \sum_{K, M} \sum_{\substack{\sigma_1 \sigma_2 \\ \sigma'_1 \sigma'_2}} \int d\mathbf{r}_{fF} d\mathbf{r}_{b1} d\mathbf{r}_{A2} [\Psi^{j_f}(\mathbf{r}_{A1}, \sigma_1) \Psi^{j_f}(\mathbf{r}_{A2}, \sigma_2)]_0^{0*}$$

$$\times \chi_{bB}^{(-)*}(\mathbf{r}_{bB}) v(\mathbf{r}_{b1}) [\Psi^{j_f}(\mathbf{r}_{A2}, \sigma_2) \Psi^{j_i}(\mathbf{r}_{b1}, \sigma_1)]_M^K$$

$$\times \int d\mathbf{r}'_{fF} d\mathbf{r}'_{b1} d\mathbf{r}'_{A2} G(\mathbf{r}_{fF}, \mathbf{r}'_{fF}) [\Psi^{j_f}(\mathbf{r}'_{A2}, \sigma'_2) \Psi^{j_i}(\mathbf{r}'_{b1}, \sigma'_1)]_M^K$$

$$\times \frac{2\mu_{fF}}{\hbar^2} v(\mathbf{r}'_{f2}) [\Psi^{j_i}(\mathbf{r}'_{b2}, \sigma'_2) \Psi^{j_i}(\mathbf{r}'_{b1}, \sigma'_1)]_\mu \chi_{aA}^{(+)}(\mathbf{r}'_{aA})$$

Two particle transfer in second order DWBA

Some details of the calculation of the differential cross section for two-nucleon transfer reactions

$$T_{2NT} = \sum_{j_f j_i} B_{j_f} B_{j_i} \left(T^{(1)}(j_i, j_f) + T_{succ}^{(2)}(j_i, j_f) - T_{NO}^{(2)}(j_i, j_f) \right)$$

Non-orthogonality term

$$T_{NO}^{(2)}(j_i, j_f) = 2 \sum_{K, M} \sum_{\substack{\sigma_1 \sigma_2 \\ \sigma'_1 \sigma'_2}} \int d\mathbf{r}_{fF} d\mathbf{r}_{b1} d\mathbf{r}_{A2} [\Psi^{j_f}(\mathbf{r}_{A1}, \sigma_1) \Psi^{j_f}(\mathbf{r}_{A2}, \sigma_2)]_0^{0*}$$

$$\times \chi_{bB}^{(-)*}(\mathbf{r}_{bB}) v(\mathbf{r}_{b1}) [\Psi^{j_f}(\mathbf{r}_{A2}, \sigma_2) \Psi^{j_i}(\mathbf{r}_{b1}, \sigma_1)]_M^K$$

$$\times \int d\mathbf{r}'_{b1} d\mathbf{r}'_{A2} [\Psi^{j_f}(\mathbf{r}'_{A2}, \sigma'_2) \Psi^{j_i}(\mathbf{r}'_{b1}, \sigma'_1)]_M^K$$

$$\times [\Psi^{j_i}(\mathbf{r}'_{b2}, \sigma'_2) \Psi^{j_i}(\mathbf{r}'_{b1}, \sigma'_1)]_\mu^\Lambda \chi_{aA}^{(+)}(\mathbf{r}'_{aA})$$

Cancellation of simultaneous and non-orthogonal contributions

very schematically, the *first order* (*simultaneous*) contribution is

$$T^{(1)} = \langle \beta | V | \alpha \rangle,$$

while the second order contribution can be separated in a *successive* and a *non-orthogonality* term

$$\begin{aligned} T^{(2)} &= T_{\text{succ}}^{(2)} + T_{\text{NO}}^{(2)} \\ &= \sum_{\gamma} \langle \beta | V | \gamma \rangle G \langle \gamma | V | \alpha \rangle - \sum_{\gamma} \langle \beta | \gamma \rangle \langle \gamma | V | \alpha \rangle. \end{aligned}$$

If we sum over a *complete basis* of intermediate states γ , we can apply the closure condition and $T_{\text{NO}}^{(2)}$ *exactly cancels* $T^{(1)}$

the transition potential being *single particle*, two-nucleon transfer is a *second order process*.

Ingredients of the calculation

Structure input for, e.g., the $^{112}\text{Sn}(p,t)^{110}\text{Sn}$ reaction:

plus the B_j spectroscopic amplitudes needed to define the two-neutron wavefunction:

$$\Phi(\mathbf{r}_1, \sigma_1, \mathbf{r}_2, \sigma_2) = \sum_j B_j [\psi^j(\mathbf{r}_1, \sigma_1) \psi^j(\mathbf{r}_2, \sigma_2)]_0^0 \quad (1)$$

“Standard procedure”: first order DWBA

$^{112}\text{Sn}(p,t)^{110}\text{Sn}$ reaction, $E_p = 26$ MeV
(Guazzoni *et al.* PRC **74** 054605 (2006))
with first order DWBA one obtains the
angular distribution of the angular
differential cross section

“Standard procedure”: first order DWBA

$^{112}\text{Sn}(p,t)^{110}\text{Sn}$ reaction, $E_p = 26$ MeV
(Guazzoni *et al.* PRC **74** 054605 (2006))
with first order DWBA one obtains the
angular distribution of the angular
differential cross section
absolute normalization \Rightarrow relative cross
sections

“Standard procedure”: first order DWBA

(Guazzoni *et al.* PRC **74** 054605 (2006))
with first order DWBA one obtains the
angular distribution of the angular
differential cross section
absolute normalization \Rightarrow relative cross
sections

Give up absolute cross sections!!

Early results with second order DWBA

Götz, Ichimura, Broglia and Winther, Phys. Rep. **16** (1975)

Igarashi, Kubo and Yagi, Phys. Rep. **199**(1991)1

Bayman and Chen, PRC **26** (1982)1509, respectively

Examples of calculations

good results obtained for halo nuclei,
population of excited states,
superfluid nuclei,
normal nuclei (pairing vibrations),
heavy ion reactions...

Potel *et al.*, arXiv:0906.4298.

From pairing vibrations

to pairing rotations:

Tin isotopic chain

$^{112}\text{Sn}(p,t)^{110}\text{Sn}$, reaction mechanism

$^{112}\text{Sn}(p,t)^{110}\text{Sn}$, results

enhancement factor with respect to the transfer of uncorrelated neutrons:

$$\varepsilon = 20.6$$

Experimental data and shell model wavefunction from Guazzoni *et al.*
PRC **74** 054605 (2006)

Pairing correlations and two-particle transfer cross sections

two-particle transfer **transition strength**: $|\langle \Psi_{A-2} | P | \Psi_A \rangle|^2$

In superfluid nuclei (open shell):

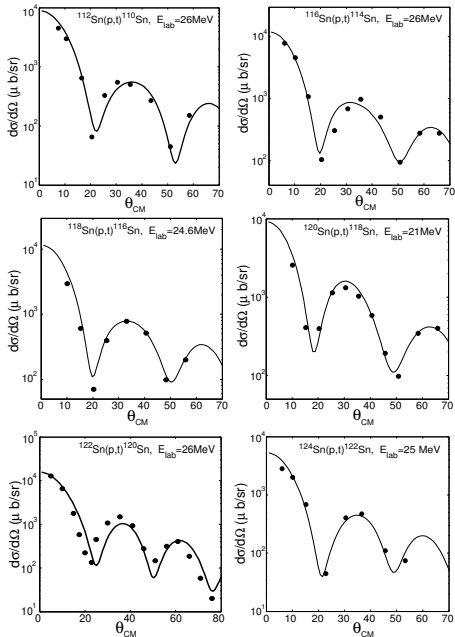

$$\langle \Psi_{A-2} | P | \Psi_A \rangle \approx \langle BCS | P | BCS \rangle = \alpha_0 = \sum_{\nu > 0} U_\nu V_\nu = \Delta / G$$

$$d\sigma / d\Omega(A, g.s. \rightarrow A + 2, g.s.) \sim \alpha_0^2$$

In normal nuclei (closed shell), $\Delta = \alpha_0 = 0$:

$$d\sigma / d\Omega \sim \langle (\alpha - \alpha_0)^2 \rangle = \left[\langle \Psi_A | P^\dagger P | \Psi_A \rangle - \langle \Psi_A | P P^\dagger | \Psi_A \rangle \right] / 2$$

$A\text{Sn}(p,t)A-2\text{Sn}$, results

Comparison with the experimental data available so far for **superfluid tin isotopes**

Potel *et al.*, PRL **107**, 092501 (2011)

$^A\text{Sn}(p,t)^{A-2}\text{Sn}$, superfluid isotopic chain

Shimoyama and Matsu, nucl-th/1106.1715

$^{134,132}\text{Sn}(p,t)^{132,130}\text{Sn}$, pairing vibrations

$^{132}\text{Sn}(p,t)^{130}\text{Sn}$ and $^{134}\text{Sn}(p,t)^{132}\text{Sn}$ reactions can probe the predicted pairing vibrations of the exotic double magic nucleus ^{132}Sn
Potel *et al.*, PRL **107**, 092501 (2011)

Conclusions

- Second order DWBA has proven to be a valuable reaction formalism to obtain reliable absolute values, along with angular distributions, for the two particle transfer nuclear reactions angular differential cross sections.
- Two nucleon transfer reactions are an ideal tool to probe two neutrons correlations in nuclei.
- We have studied the transition between pairing vibrational (closed shell) to pairing rotational (superfluid) regimes in the tin isotopic chain.
- We hope that the predictions made for reactions with exotic beams such as $^{132}\text{Sn}(p,t)^{130}\text{Sn}$ will stimulate future experiments!

Thank You!
