Introduction

Introduction

BB interactions are inputs for nuclear structure, astrophysical phenomena

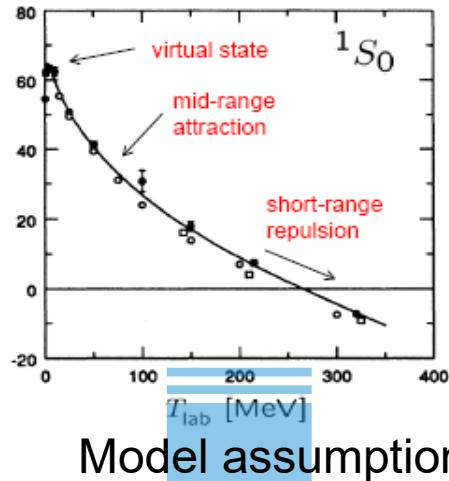

Once we obtain a “reliable” nuclear potential,
we apply them to the structure of (hyper-) nucleus
and neutron star calculation

Phenomenological descriptions

Traditional process to research the BB interaction / potential

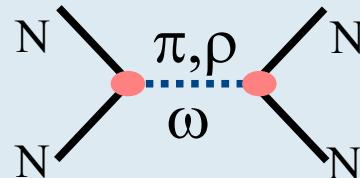

Scattering observables

Model assumption

Meson exchange model

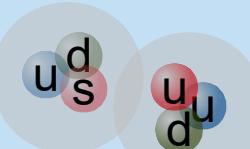

Described by hadron d.o.f.

+ Phenomenological repul. core
H. Yukawa, PPMS17(1935)48
Th.A.Rijken, PTPS185(2010)14

Quark cluster model

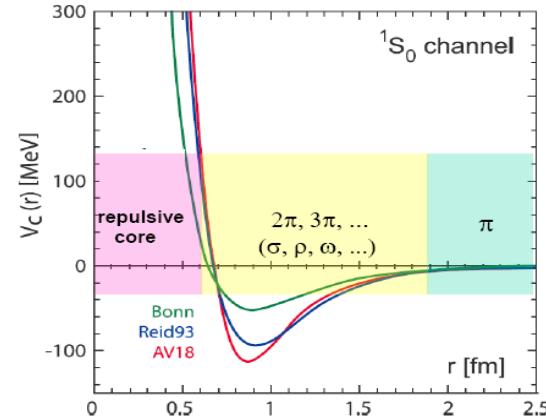

Effective meson ex
+ quark anti-symmetrization

Quark Pauli effects
Color magnetic int.

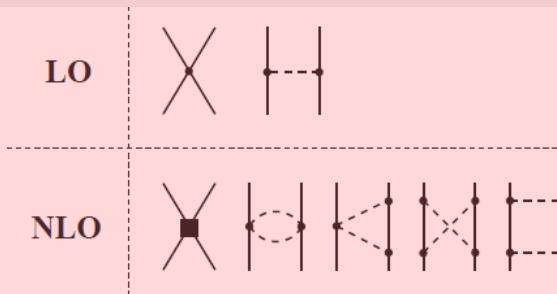

M.Oka, PTPS137(2000)1
Y.Fujiwara, PPNP58(2007)439

BB interaction (potential)

Effective Field theory

Systematic calc. respecting with symmetry of QCD

Short range interaction is parametrized by contact term

E. Epelbaum, RMP81(2009)1773
R. Machleidt, PRept.503(2011)1

The models would be highly ambiguous if experimental data are scarce!

Introduction

Aim : Nuclear structures and exotic states from QCD

Lattice QCD simulation

- Advantageous for **more strange quarks**
- Signals getting worse as increasing the number of light quarks.
- Complementary role to experiment.

Main topics of **S=-2 multi-baryon system**

▶ **H-dibaryon**

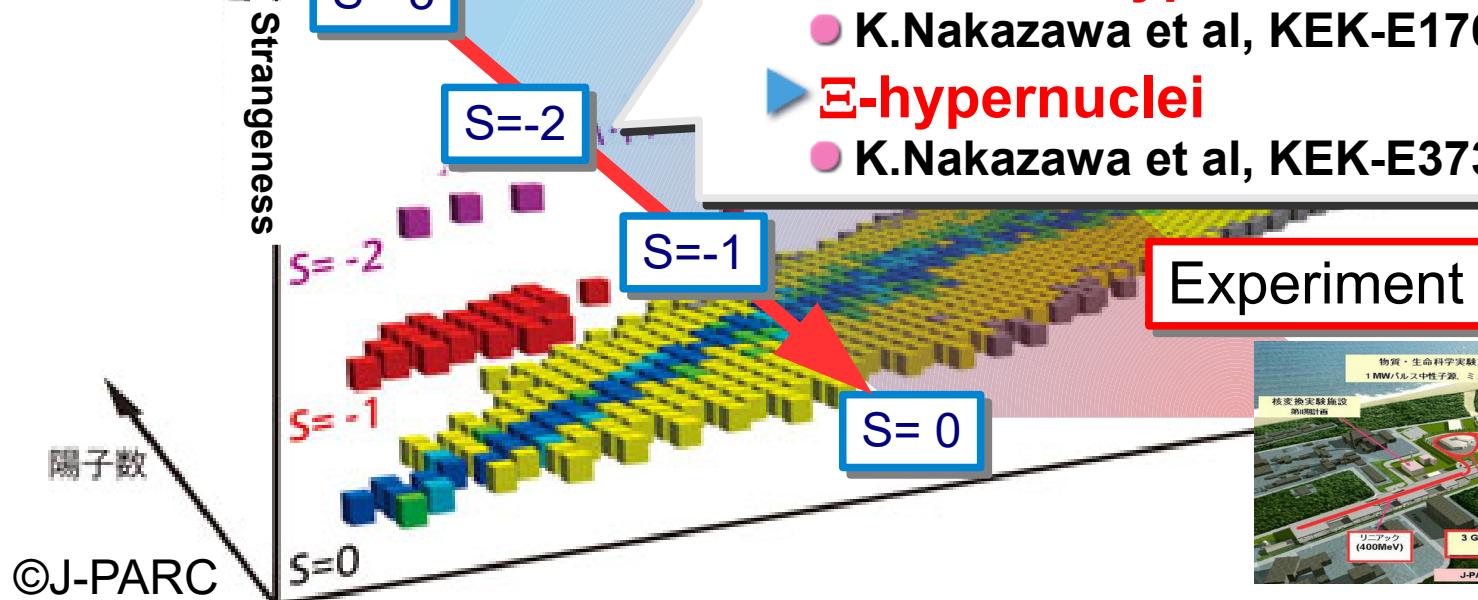

● R.L. Jaffe, PRL 38 (1977) 195

▶ **Double- Λ hypernuclei**

● K.Nakazawa et al, KEK-E176 Collaboration

▶ **Ξ -hypernuclei**

● K.Nakazawa et al, KEK-E373 Collaboration

Interests of S=-2 multi-baryon system

H-dibaryon

- The flavor singlet state with J=0 predicted by R.L. Jaffe.
- Strongly attractive color magnetic interaction.
- No quark Pauli principle for flavor singlet state.

Double- Λ hypernucleus

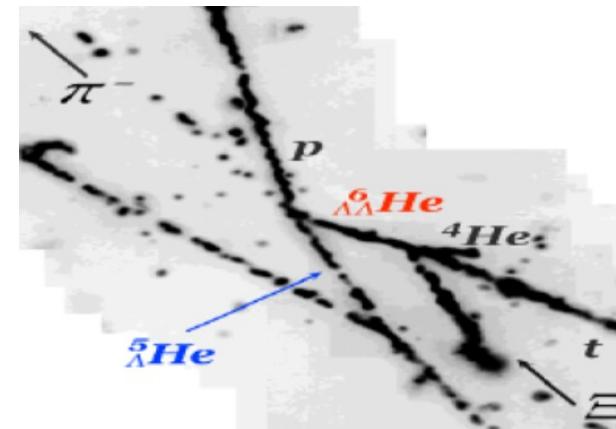

- Conclusions of the “NAGARA Event”

K.Nakazawa and KEK-E176 & E373 Collaborators

Λ -N attraction

Λ - Λ weak attraction

$$m_{\Lambda} \geq 2m_N - 6.9 \text{ MeV}$$

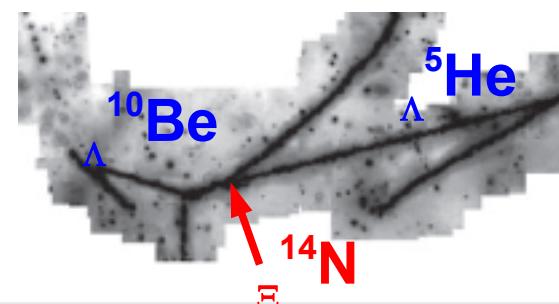

Ξ hypernucleus

- Conclusions of the “KISO Event”

K.Nakazawa and KEK-E373 Collaborators

Ξ -N attraction

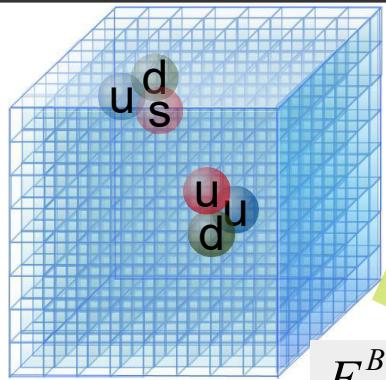

HAL QCD method

Derivation of hadronic interaction from QCD

Start with the fundamental theory, QCD

Lattice QCD simulation

$$F^{B_1 B_2}_I(t, \vec{r}) = \langle 0 | B_1 B_2(t, \vec{r}) \bar{I}(t_0) | 0 \rangle = A_0 \Psi(\vec{r}, E_0) e^{-E_0(t-t_0)} + \dots$$

Lüscher's finite volume method

M. Lüscher, NPB354(1991)531

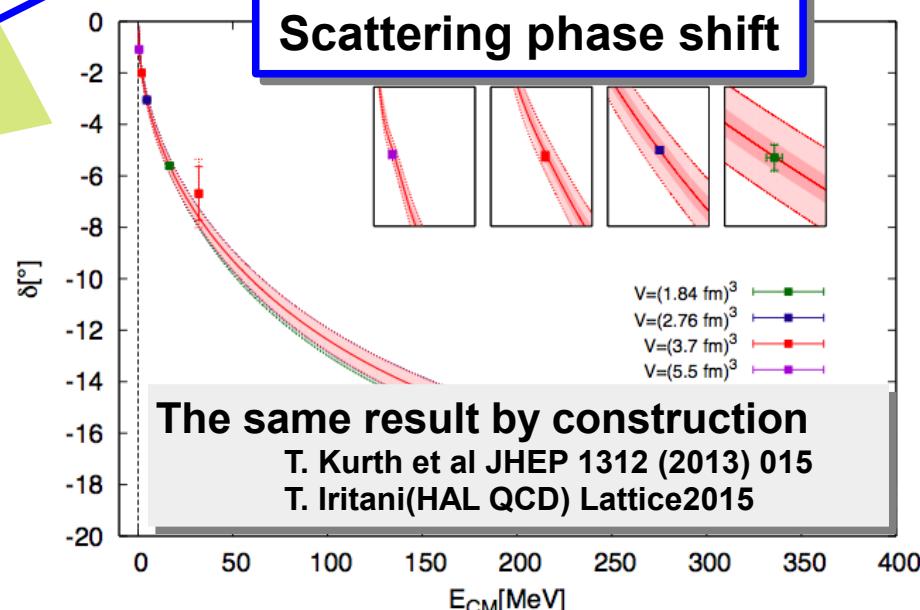

1. Measure the discrete energy spectrum, E
2. Put the E into the formula which connects E and δ

HAL QCD method

Ishii, Aoki, Hatsuda, PRL99 (2007) 022001

1. Measure the NBS wave function, Ψ
2. Calculate potential, V , through Schrödinger eq.
3. Calculate observables by scattering theory

Scattering phase shift

Nambu-Bethe-Salpeter wave function

Definition : equal time NBS w.f.

$$\Psi^a(E, \vec{r}) e^{-Et} = \sum_{\vec{x}} \langle 0 | H_1^a(t, \vec{x} + \vec{r}) H_2^a(t, \vec{x}) | E \rangle$$

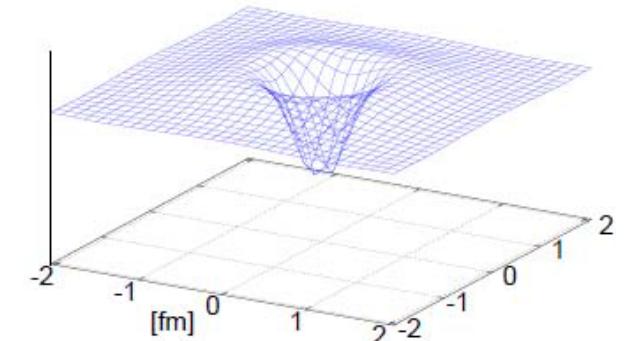

E : Total energy of the system

Local composite interpolating operators

$$B_\alpha = \epsilon^{abc} (q_a^T C \gamma_5 q_b) q_{c\alpha} \quad D_{\mu\alpha} = \epsilon^{abc} (q_a^T C \gamma_\mu q_b) q_{c\alpha}$$

$$M = (\bar{q}_a \gamma_5 q_a)$$

Etc.....

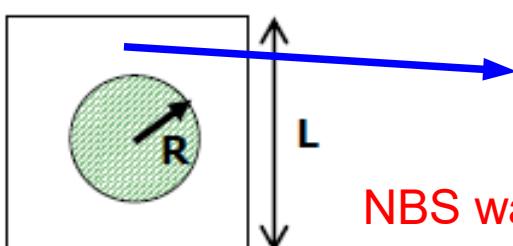

It satisfies the Helmholtz eq. in asymptotic region : $(p^2 + \nabla^2) \Psi(E, \vec{r}) = 0$

Using the reduction formula,

C.-J.D.Lin et al., NPB619 (2001) 467.

$$\Psi^a(E, \vec{r}) = \sqrt{Z_{H_1}} \sqrt{Z_{H_2}} \left(e^{i \vec{p} \cdot \vec{r}} + \int \frac{d^3 q}{2 E_q} \frac{T(q, p)}{4 E_p (E_q - E_p - i\epsilon)} e^{i \vec{q} \cdot \vec{r}} \right)$$

$$\Psi(E, \vec{r}) \simeq A \frac{\sin(pr + \delta(E))}{pr}$$

Phase shift is defined as
 $S \equiv e^{i\delta}$

NBS wave function has a same asymptotic form with quantum mechanics.
(NBS wave function is characterized from phase shift)

Time-dependent Schrödinger like equation

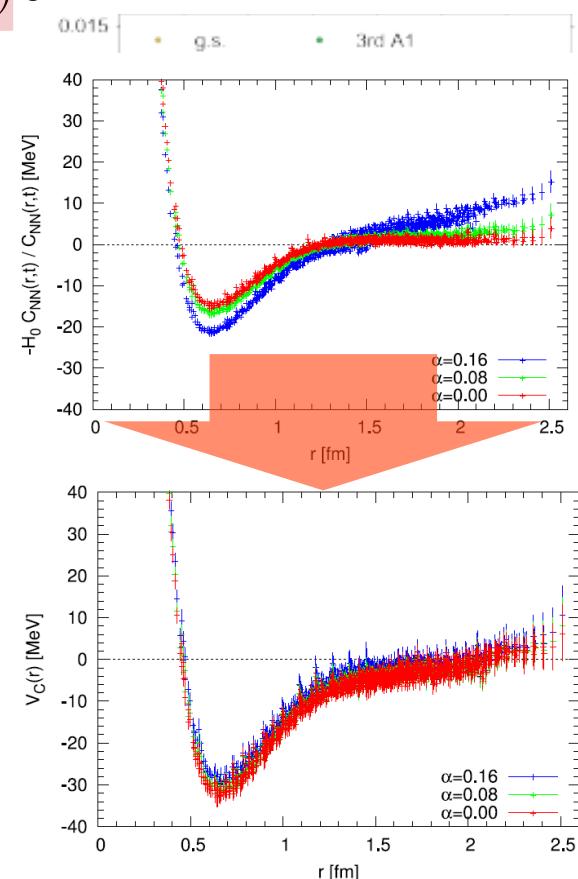

Start with the normalized four-point correlator.

$$R_I^{B_1 B_2}(t, \vec{r}) = F_I^{B_1 B_2} e^{(m_1 + m_2)t} = A_0 \Psi(\vec{r}, E_0) e^{-(E_0 - m_1 - m_2)t} + A_1 \Psi(\vec{r}, E_1) e^{-(E_1 - m_1 - m_2)t} + \dots$$

$$\left(\frac{p_0^2}{2\mu} + \frac{\nabla^2}{2\mu} \right) \Psi(\vec{r}, E_0) = \int U(\vec{r}, \vec{r}') \Psi(\vec{r}', E_0) d^3 r'$$

$$E_n - m_1 - m_2 \approx \frac{p_n^2}{2\mu} \quad \left(\frac{p_1^2}{2\mu} + \frac{\nabla^2}{2\mu} \right) \Psi(\vec{r}, E_1) = \int U(\vec{r}, \vec{r}') \Psi(\vec{r}', E_1) d^3 r'$$

A single state saturation is not required!!

$$\left(-\frac{\partial}{\partial t} + \frac{\nabla^2}{2\mu} \right) R_I^{B_1 B_2}(t, \vec{r}) = \int U(\vec{r}, \vec{r}') R_I^{B_1 B_2}(t, \vec{r}') d^3 r'$$

Derivative (velocity) expansion of U

$$U(\vec{r}, \vec{r}') = [V_C(r) + S_{12} V_T(r)] + [\vec{L} \cdot \vec{S}_s V_{LS}(r) + \vec{L} \cdot \vec{S}_a V_{ALS}(r)] + O(\nabla^2)$$

HAL QCD method

NBS wave function

$$\Psi(E, \vec{r}) e^{-E(t-t_0)} = \sum_{\vec{x}} \langle 0 | B_i(t, \vec{x} + \vec{r}) B_j(t, \vec{x}) | E, t_0 \rangle$$

E : Total energy of system

- In asymptotic region : $(p^2 + \nabla^2) \Psi(E, \vec{r}) = 0$
- In interaction region : $(p^2 + \nabla^2) \Psi(E, \vec{r}) = K(E, \vec{r})$

$$\Psi(E, \vec{r}) \simeq A \frac{\sin(pr + \delta(E))}{pr}$$

Aoki, Hatsuda, Ishii, PTP123, 89 (2010).

Modified Schrödinger equation

$$\left(-\frac{\partial}{\partial t} + \frac{\nabla^2}{2\mu} \right) R_I^{B_1 B_2}(t, \vec{r}) = \int U(\vec{r}, \vec{r}') R_I^{B_1 B_2}(t, \vec{r}') d^3 r'$$

N. Ishii et al Phys. Lett. B712(2012)437

Derivative expansion

$$U(\vec{r}, \vec{r}') = V_C(r) + S_{12} V_T(r) + \vec{L} \cdot \vec{S}_s V_{LS}(r) + \vec{L} \cdot \vec{S}_a V_{ALS}(r) + O(\nabla^2)$$

Potential

$$V(\vec{r}) = \left(-\frac{\partial}{\partial t} + \frac{\nabla^2}{2\mu} \right) R_I^{B_1 B_2}(t, \vec{r}) / R_I^{B_1 B_2}(t, \vec{r})$$

K. Murano et al Phys.Lett. B735 (2014) 19

HAL QCD method (coupled-channel)

NBS wave function

$$\Psi^\alpha(E_i, \vec{r}) e^{-E_i t} = \langle 0 | (B_1 B_2)^\alpha(\vec{r}) | E_i \rangle$$

$$\Psi^\beta(E_i, \vec{r}) e^{-E_i t} = \langle 0 | (B_1 B_2)^\beta(\vec{r}) | E_i \rangle$$

$$\int dr \tilde{\Psi}_\beta(E', \vec{r}) \Psi^\gamma(E, \vec{r}) = \delta(E' - E) \delta_\beta^\gamma$$

$$R_E^{B_1 B_2}(t, \vec{r}) = \Psi_{B_1 B_2}(\vec{r}, E) e^{(-E + m_1 + m_2)t}$$

Leading order of velocity expansion and time-derivative method.

Modified coupled-channel Schrödinger equation

$$\begin{pmatrix} \left(-\frac{\partial}{\partial t} + \frac{\nabla^2}{2\mu_\alpha} \right) R_{E_0}^\alpha(t, \vec{r}) \\ \left(-\frac{\partial}{\partial t} + \frac{\nabla^2}{2\mu_\beta} \right) R_{E_0}^\beta(t, \vec{r}) \end{pmatrix} = \begin{pmatrix} V_\alpha^\alpha(\vec{r}) & V_\beta^\alpha(\vec{r}) \Delta_\beta^\alpha(t) \\ V_\alpha^\beta(\vec{r}) \Delta_\alpha^\beta(t) & V_\beta^\beta(\vec{r}) \end{pmatrix} \begin{pmatrix} R_{E_0}^\alpha(t, \vec{r}) \\ R_{E_0}^\beta(t, \vec{r}) \end{pmatrix}$$

$$\left(-\frac{\partial}{\partial t} + \frac{\mathbf{v}}{2\mu_\beta} \right) R_{E_1}^\beta(t, \vec{r}) = \begin{pmatrix} \Delta_\beta^\alpha = \frac{\exp(-(m_{\alpha_1} + m_{\alpha_2})t)}{\exp(-(m_{\beta_1} + m_{\beta_2})t)} & V_\beta^\alpha(\vec{r}) \Delta_\beta^\alpha(t) \\ V_\beta^\beta(\vec{r}) & \end{pmatrix} \begin{pmatrix} R_{E_1}^\alpha(t, \vec{r}) \\ R_{E_1}^\beta(t, \vec{r}) \end{pmatrix}$$

S.Aoki et al [HAL QCD Collab.] Proc. Jpn. Acad., Ser. B, 87 509

K.Sasaki et al [HAL QCD Collab.] PTEP no 11 (2015) 113B01

Potential

Considering two different energy eigen states

$$\begin{pmatrix} V_\alpha^\alpha(\vec{r}) & V_\beta^\alpha(\vec{r}) \Delta_\beta^\alpha \\ V_\alpha^\beta(\vec{r}) \Delta_\alpha^\beta & V_\beta^\beta(\vec{r}) \end{pmatrix} = \begin{pmatrix} \left(\frac{\nabla^2}{2\mu_\alpha} - \frac{\partial}{\partial t} \right) R_{E_0}^\alpha(t, \vec{r}) & \left(\frac{\nabla^2}{2\mu_\beta} - \frac{\partial}{\partial t} \right) R_{E_1}^\alpha(t, \vec{r}) \\ \left(\frac{\nabla^2}{2\mu_\alpha} - \frac{\partial}{\partial t} \right) R_{E_0}^\beta(t, \vec{r}) & \left(\frac{\nabla^2}{2\mu_\beta} - \frac{\partial}{\partial t} \right) R_{E_1}^\beta(t, \vec{r}) \end{pmatrix} \begin{pmatrix} R_{E_0}^\alpha(t, \vec{r}) & R_{E_1}^\alpha(t, \vec{r}) \\ R_{E_0}^\beta(t, \vec{r}) & R_{E_1}^\beta(t, \vec{r}) \end{pmatrix}^{-1}$$

S=-2 baryon-baryon potentials

$$\Sigma\Sigma \Leftrightarrow 8$$

$J^p=1^+, I=1$

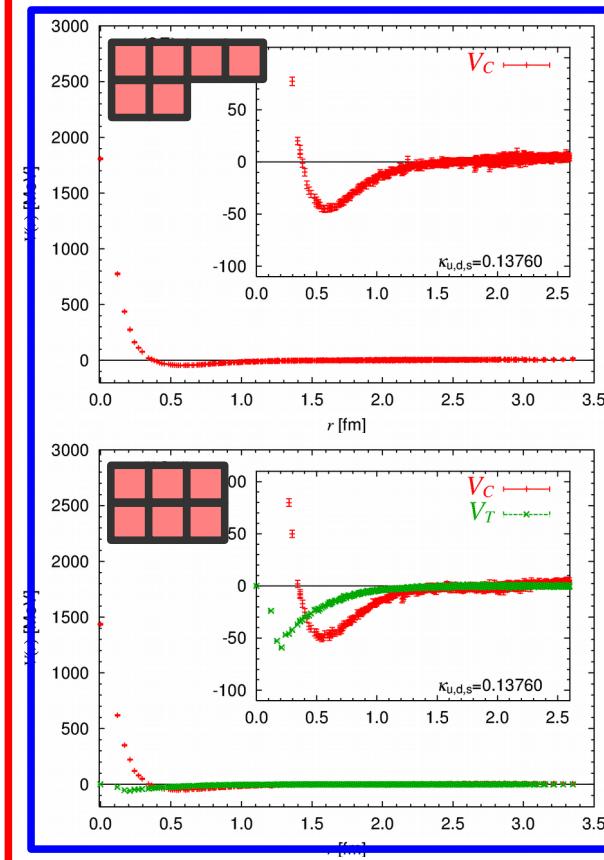

$$\begin{pmatrix} N\Xi \\ \Sigma\Lambda \\ \Sigma\Sigma \end{pmatrix} = \frac{1}{\sqrt{6}} \begin{pmatrix} -\sqrt{2} & -\sqrt{2} & \sqrt{2} \\ \sqrt{3} & -\sqrt{3} & 0 \\ 1 & 1 & \sqrt{4} \end{pmatrix} \begin{pmatrix} 8 \\ 10 \\ 10 \end{pmatrix}$$

Features of flavor singlet interaction is integrated into the $S=-2 J^p=0^+, I=0$ system.

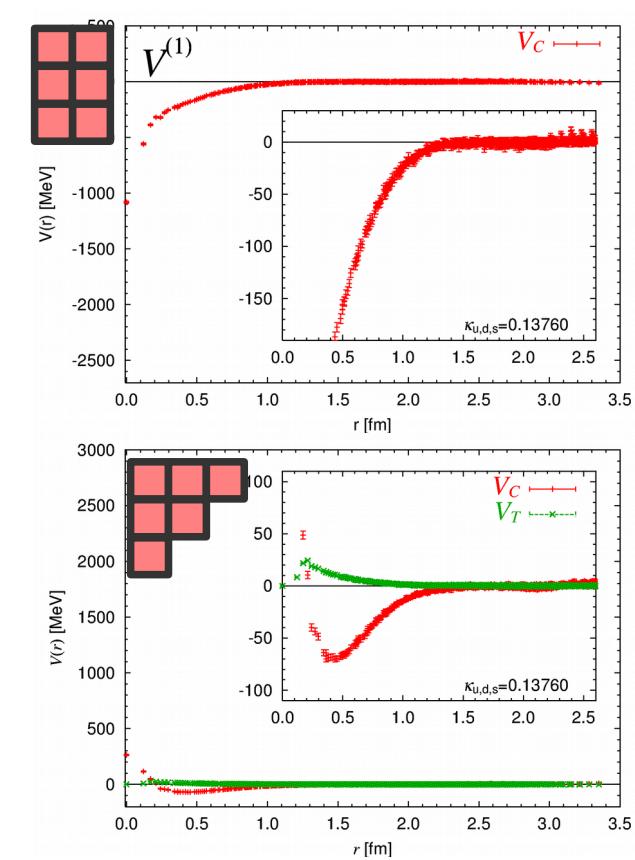

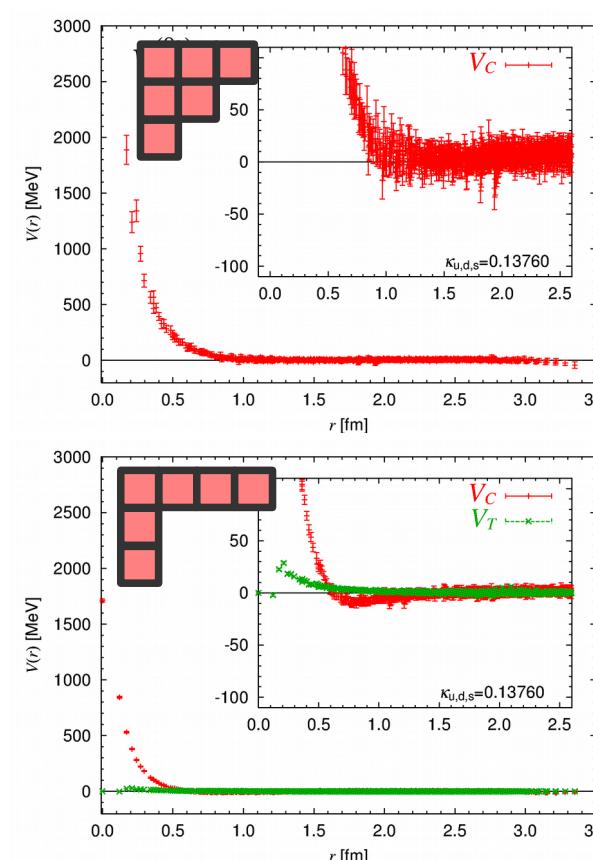

B-B potentials in SU(3) limit

$m_\pi = 469 \text{ MeV}$

$1S_0$

$3S_1 - 3D_1$

Two-flavors

Three-flavors

- Quark Pauli principle can be seen at around short distances
- No repulsive core in flavor singlet state
- Strongest repulsion in flavor 8s state
- **Possibility of bound H-dibaryon in flavor singlet channel.**

SU(3) feature of BB interaction

In view of quark degrees of freedom

Oka, Shimizu and Yazaki NPA464 (1987)

- Short range repulsion in BB interaction could be a result of Pauli principle and color-magnetic interaction for the quarks.
- Strengths of repulsive core in YN and YY interaction are largely depend on their flavor structures.
- For the s-wave BB system, no repulsive core is predicted in flavor singlet state which is known as H-dibaryon channel.

• Flavor symmetry aspect

	1	8s	27	8a	10	10*
Pauli	allowed	forbidden	---	allowed	forbidden	---
CMI	attractive	repulsive	repulsive	repulsive	repulsive	repulsive
Short range int.	attractive	repulsive	repulsive	repulsive	repulsive	repulsive

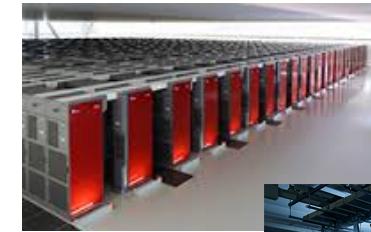

Numerical setup

► 2+1 flavor gauge configurations.

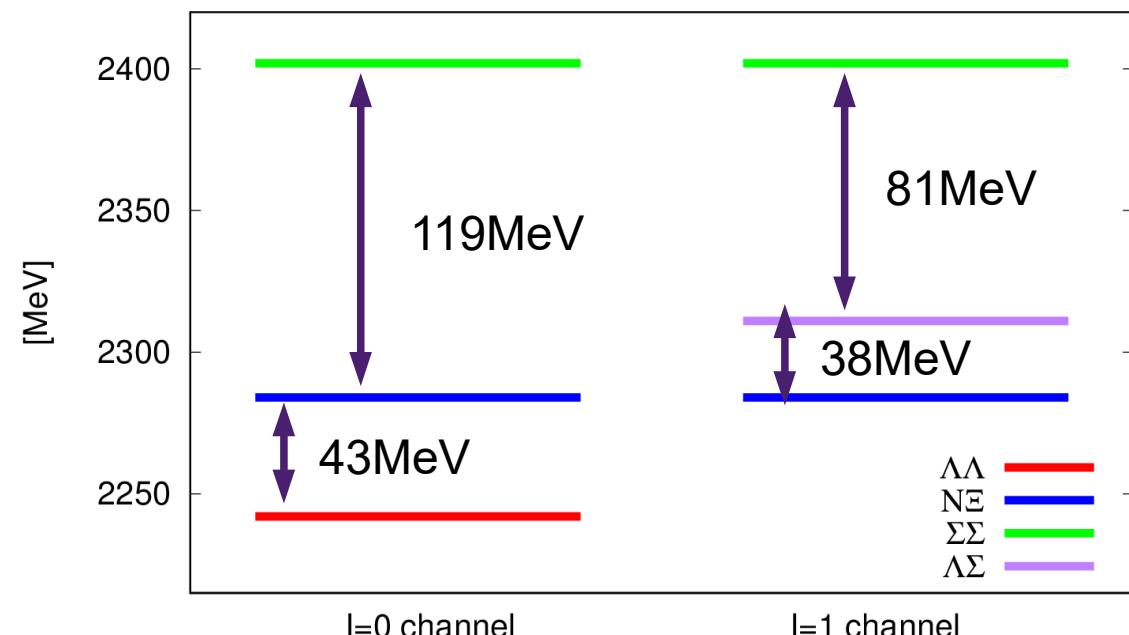

- Iwasaki gauge action & O(a) improved Wilson quark action
- $a = 0.085 [fm]$, $a^{-1} = 2.333 \text{ GeV}$.
- $96^3 \times 96$ lattice, $L = 8.21 [fm]$.
- 414 confs x 48 sources x 4 rotations.

► Wall source is considered to produce S-wave B-B state.

	Mass [MeV]
π	146
K	525
m_π/m_K	0.28
N	953 ± 7
Λ	1123 ± 3
Σ	1204 ± 1
Ξ	1336 ± 2

$\Sigma\Sigma$ ($I=2$) 1S_0 channel

► $N_f = 2+1$ full QCD $m\pi = 146$ MeV with $L = 8.1$ fm

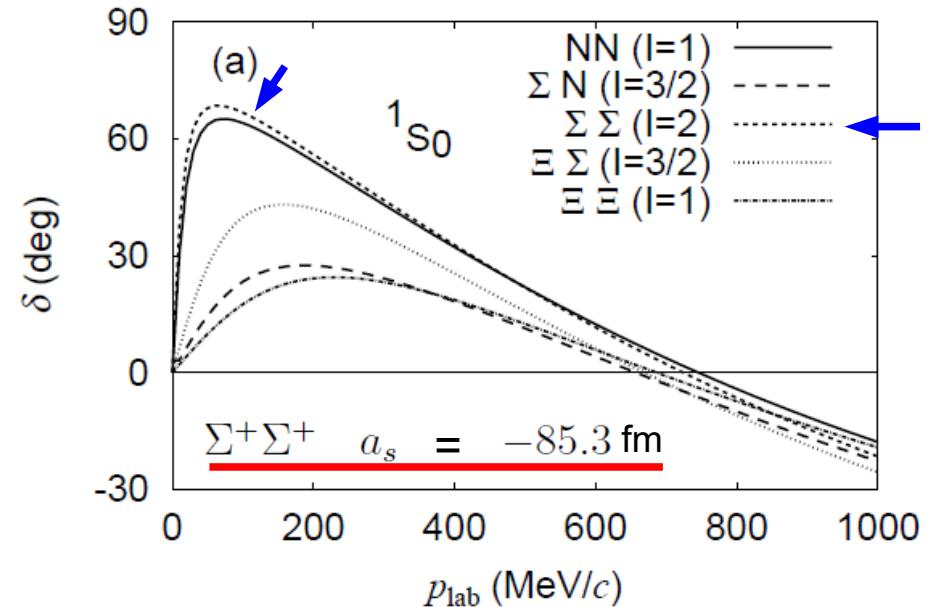

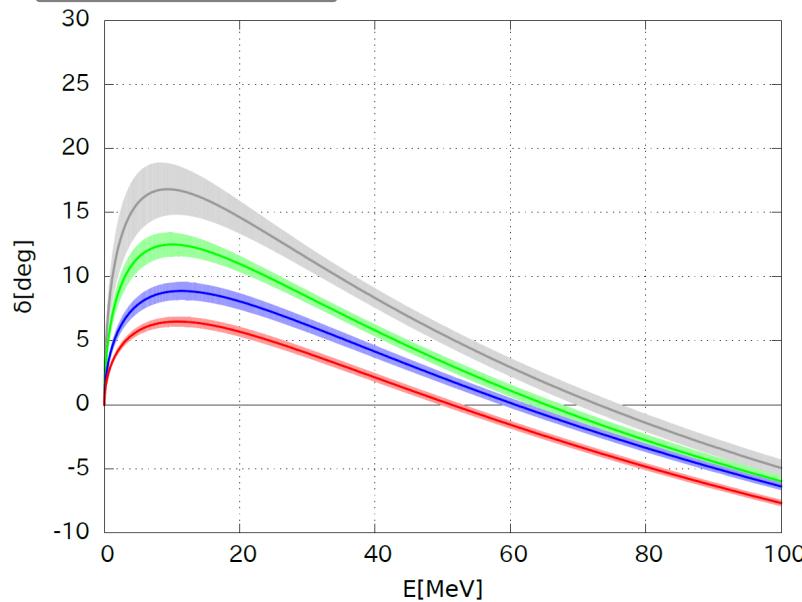

Preliminary!

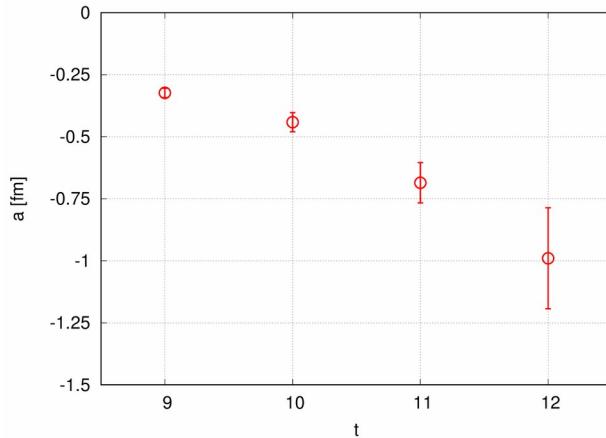

- $\Sigma\Sigma$ ($I=2$) potential belongs to the 27plet in flavor SU(3) limit.
- The potential has an attractive pocket and repulsive core.
- In this time range, potentials are qualitatively similar.
- Potential is saturated even $t=12\dots$

$\Sigma\Sigma$ ($I=2$) 1S_0 channel –comparison--

Phase shift

Scattering length

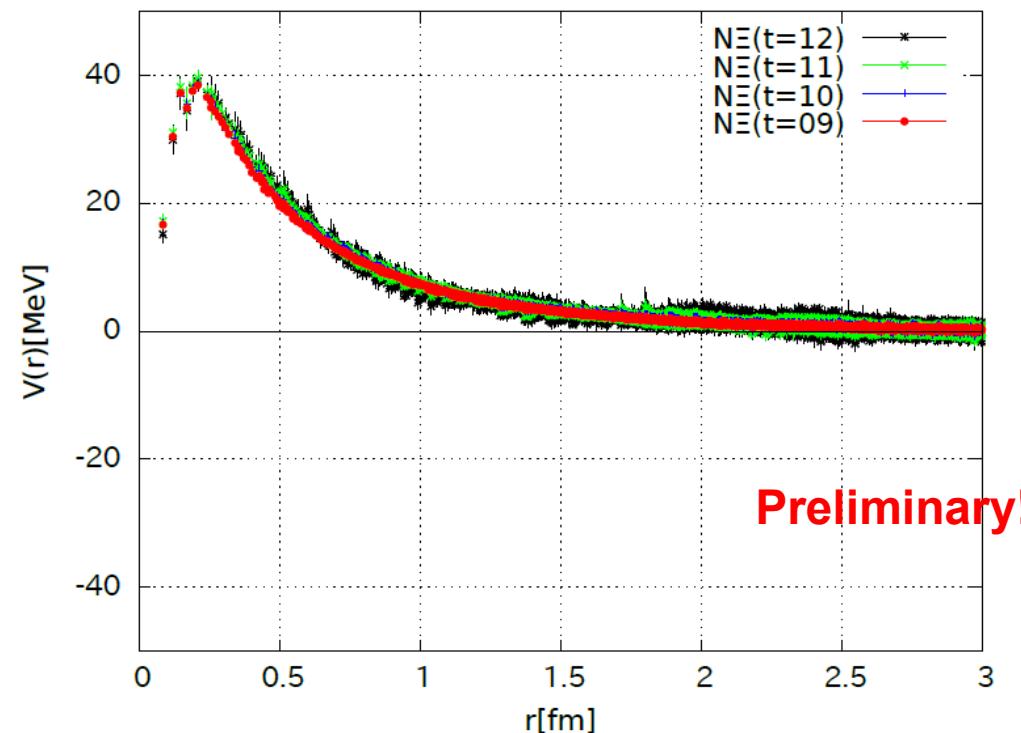

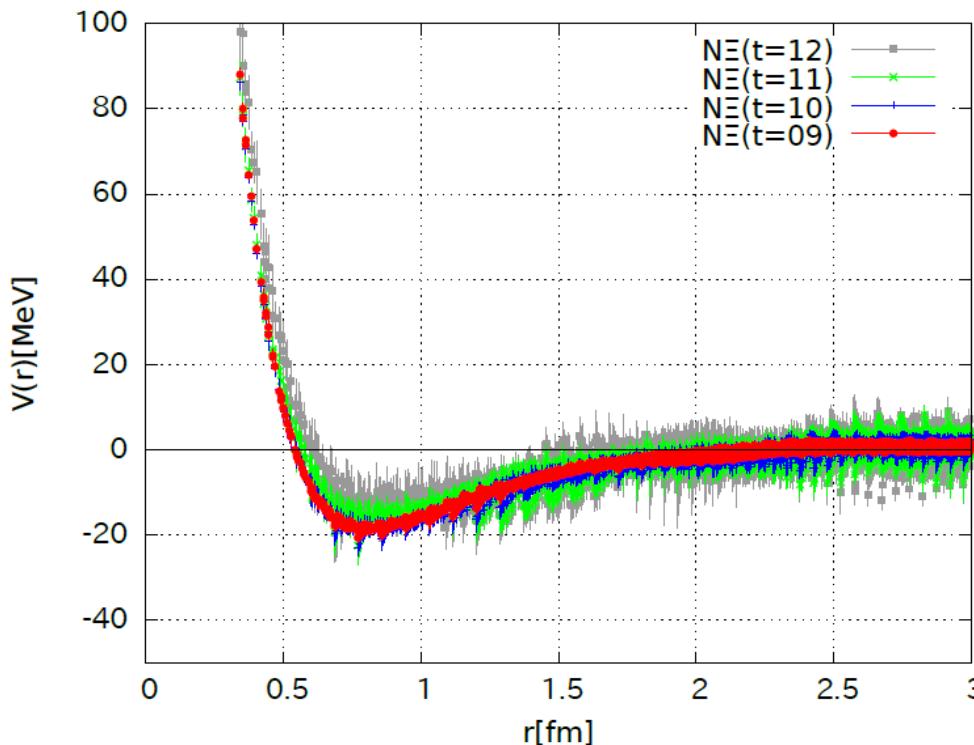

Λ	NLO				LO				
	500	550	600	650	550	600	650	700	
$\Sigma^+\Sigma^+$	a_{1S0}	-2.19	-1.94	-1.83	-1.82	-6.23	-7.76	-9.42	-9.27

J. Haidenbauer et al, NPA954(2016)273

- Scattering length in $\Sigma\Sigma$ ($I=2$) channel is not saturated.
- Attraction is strengthened as increasing t .
- Attraction is much weaker than the phenomenological one.

$N\Xi$ ($I=0$) 3S_1 - 3D_1 channel

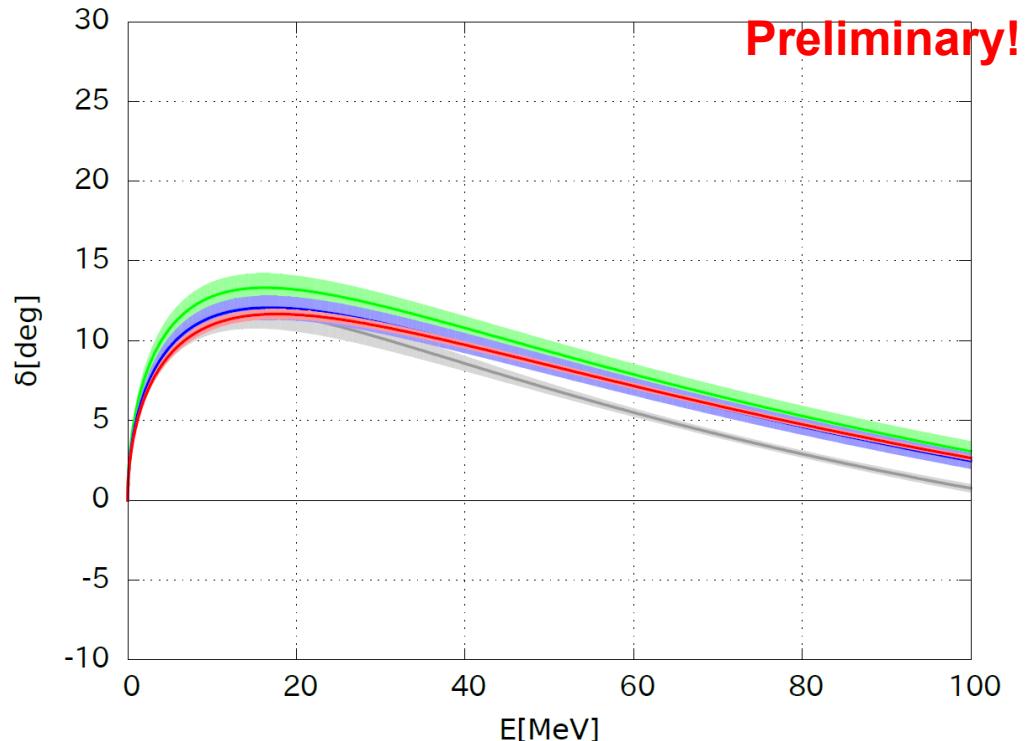

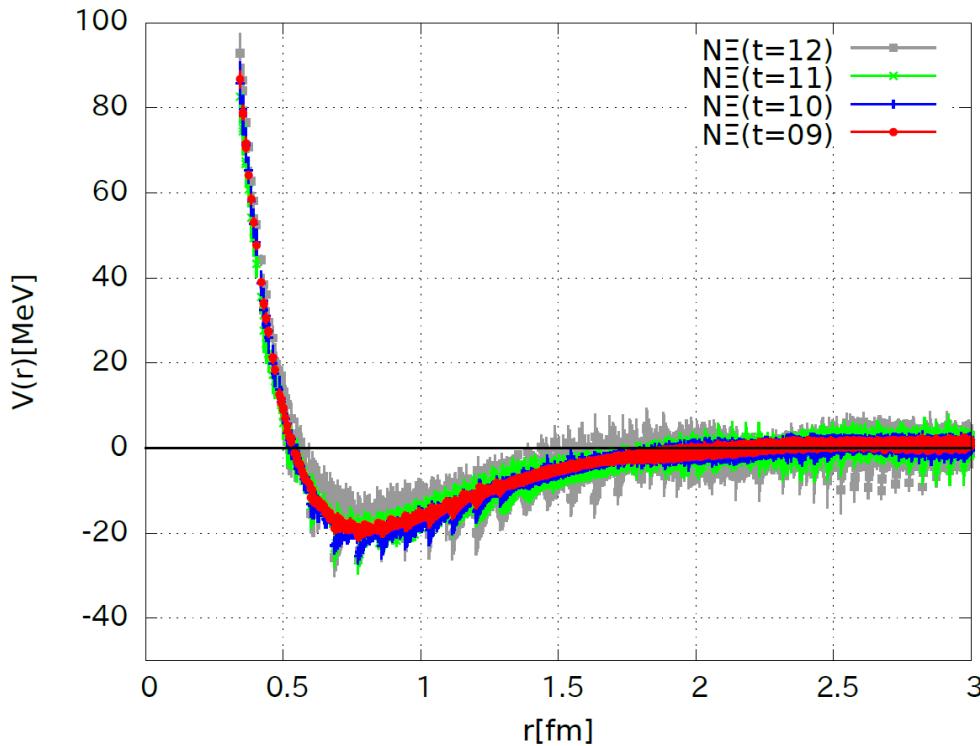

► $N_f = 2+1$ full QCD $m_\pi = 146$ MeV with $L = 8.1$ fm

- $N\Xi$ ($I=0$, spin triplet) potential belongs to the 8plet in flavor SU(3) limit.
- The potential has an attractive pocket and repulsive core.
- Tensor potential is weaker than the phenomenological NN tensor potential.

$N\Xi$ ($I=0$) 3S_1 channel (effective central potential)

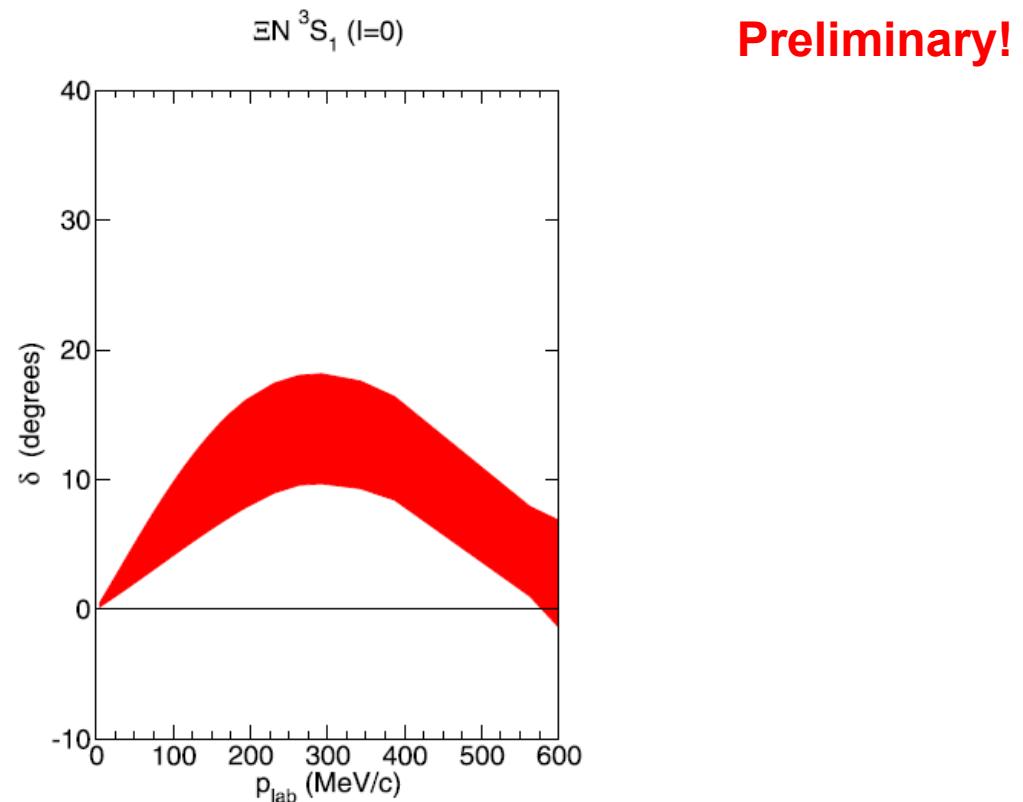

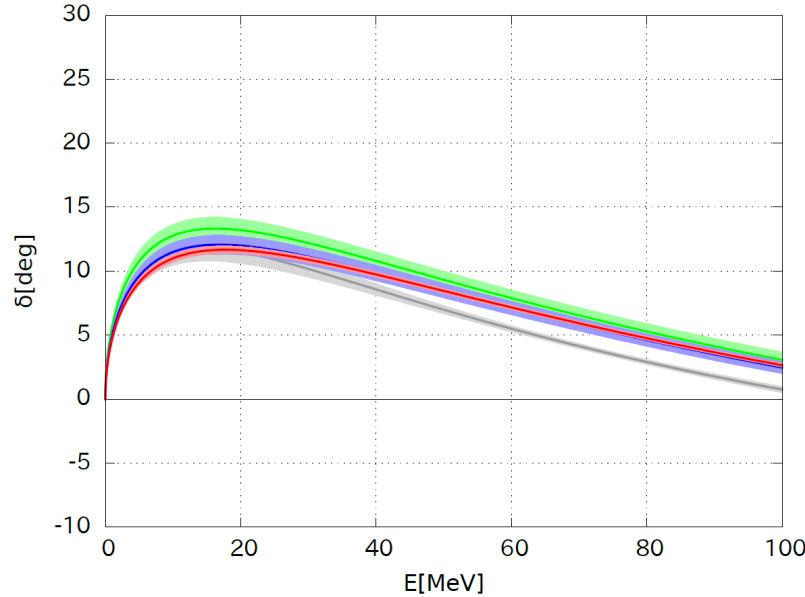

► $N_f = 2+1$ full QCD $m_\pi = 146$ MeV with $L = 8.1$ fm

- Effective $N\Xi$ ($I=0$, spin triplet) central potential is plotted.
- It belongs to the 8a-plet in the SU(3) limit.
- Phase shifts at low energies are same within the error bars.

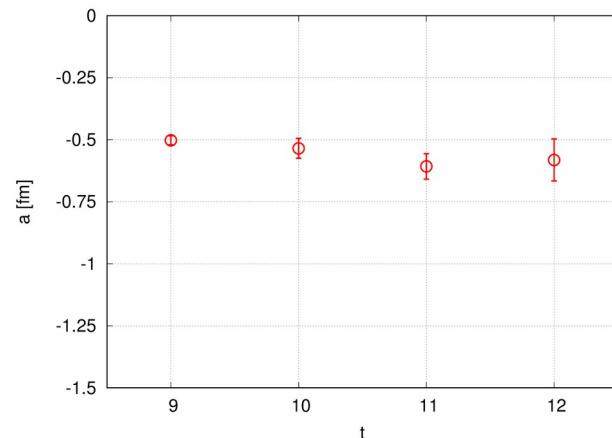

$N\Xi$ ($I=0$) 3S_1 channel –comparison--

Phase shift

Preliminary!

Scattering length

Λ	NLO				LO				
	500	550	600	650	550	600	650	700	
$I = 0$	a_{3S1}	-0.33	-0.39	-0.62	-0.85	-0.85	-0.59	-0.43	-0.32
	r_{3S1}	-6.87	-1.77	1.00	1.42	-1.84	-3.93	-7.16	-12.56

J. Haidenbauer et al, NPA954(2016)273

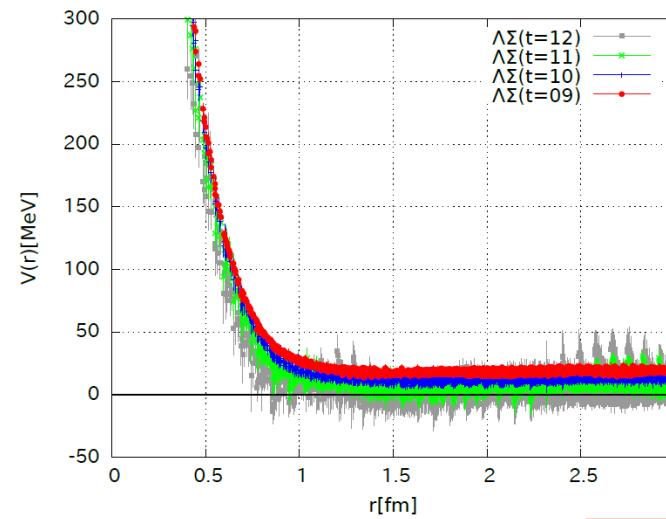

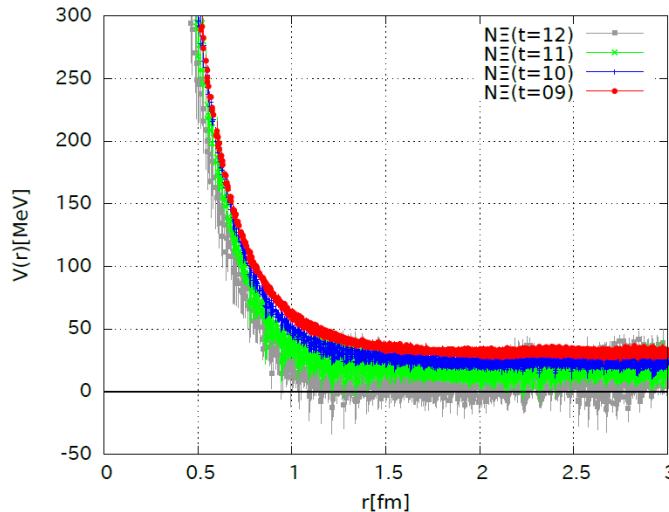

- Phase shift and scattering length are saturated (?).
- They are comparable with the results of NLO EFT calculation.

$N\Xi, \Lambda\Sigma$ ($I=1$) 1S_0 channel

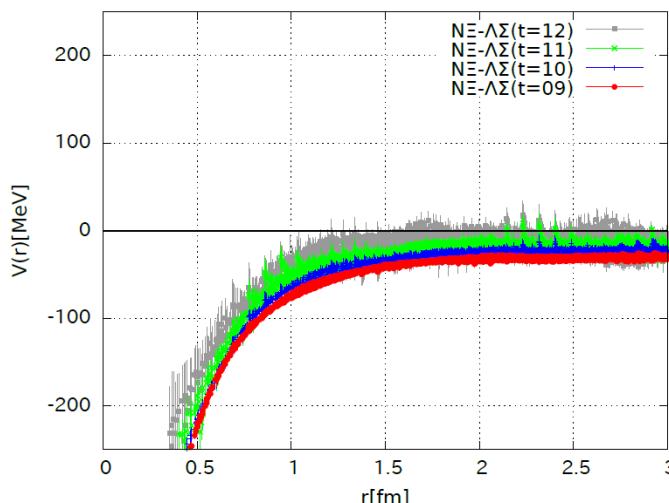

► $N_f = 2+1$ full QCD $m_\pi = 146$ MeV with $L = 8.1$ fm

Preliminary!

Diagonal elements

Off-diagonal elements

$$\begin{pmatrix} N\Xi \\ \Sigma\Lambda \end{pmatrix} = \frac{1}{5} \begin{pmatrix} \sqrt{2} & -\sqrt{3} \\ \sqrt{3} & \sqrt{2} \end{pmatrix} \begin{pmatrix} 27 \\ 8 \end{pmatrix}$$

- Diagonal elements are repulsive in whole range.
- Diagonal $N\Xi$ potential is strongly repulsive.
- It means that the $N\Xi$ potential is strongly depend on the channel.
- Potentials are not saturated in this time range.

48src

Off-diagonal elements

Comparison of potential matrices

Transformation of potentials
from the particle basis to the SU(3) irreducible representation (irrep) basis.

SU(3) Clebsh-Gordan coefficients

$$\begin{pmatrix} |1\rangle \\ |8\rangle \\ |27\rangle \end{pmatrix} = U \begin{pmatrix} |\Lambda\Lambda\rangle \\ |N\Sigma\rangle \\ |\Sigma\Sigma\rangle \end{pmatrix}, \quad U \begin{pmatrix} V^{\Lambda\Lambda} & V^{\Lambda\Lambda}_{N\Sigma} & V^{\Lambda\Lambda}_{\Sigma\Sigma} \\ V^{N\Sigma}_{\Lambda\Lambda} & V^{N\Sigma} & V^{N\Sigma}_{\Sigma\Sigma} \\ V^{\Sigma\Sigma}_{\Lambda\Lambda} & V^{\Sigma\Sigma}_{N\Sigma} & V^{\Sigma\Sigma} \end{pmatrix} U^t \rightarrow \begin{pmatrix} V_1 \\ V_8 \\ V_{27} \end{pmatrix}$$
$$\begin{pmatrix} |\Lambda\Lambda\rangle \\ |N\Sigma\rangle \\ |\Sigma\Sigma\rangle \end{pmatrix} = \frac{1}{\sqrt{40}} \begin{pmatrix} -\sqrt{5} & -\sqrt{8} & \sqrt{27} \\ \sqrt{20} & \sqrt{8} & \sqrt{12} \\ \sqrt{15} & -\sqrt{24} & -1 \end{pmatrix} \begin{pmatrix} |1\rangle \\ |8\rangle \\ |27\rangle \end{pmatrix}$$

In the SU(3) irreducible representation basis,
the potential matrix should be diagonal in the SU(3) symmetric configuration.

Off-diagonal part of the potential matrix in the SU(3) irrep basis
would be an effective measure of the SU(3) breaking effect.

H-dibaryon channel

Keys to understand H-dibaryon state

A strongly bound state predicted by Jaffe in 1977 using MIT bag model.

H-dibaryon state is

- SU(3) flavor singlet [uuddss], strangeness S=-2.
- spin and isospin equals to zero, and $J^P = 0^+$

► Strongly attractive interaction is expected in flavor singlet channel.

- Short range one-gluon exchange contributions

Strongly attractive Color Magnetic Interaction

- Symmetry of two-baryon system (Pauli principle)

Flavor singlet channel is free from Pauli blocking effect

	27	8	1	10	10	8

Hunting for H-dibaryon in $SU(3)$ limit

Strongly attractive interaction is expected in flavor singlet channel.

- Strongly attractive potential was found in the flavor singlet channel.
- Bound state was found in this mass range with $SU(3)$ symmetry.
- What happens at the physical point?
- SU(3) breaking effects
 - Threshold separation
 - Changes of interactions

T.Inoue et al[HAL QCD Coll.] NPA881(2012) 28

Effective $\Lambda\Lambda$ and $N\Xi$ potential

Effective two channel potential

► *Original coupled channel equation*

$$\begin{pmatrix} (E^{\Lambda\Lambda} - H_0^{\Lambda\Lambda}) R^{\Lambda\Lambda}(\vec{r}, t) \\ (E^{\Xi N} - H_0^{\Xi N}) R^{\Xi N}(\vec{r}, t) \\ (E^{\Sigma\Sigma} - H_0^{\Sigma\Sigma}) R^{\Sigma\Sigma}(\vec{r}, t) \end{pmatrix} = \begin{pmatrix} V_{\Lambda\Lambda}^{\Lambda\Lambda}(\vec{r}) & V_{\Xi N}^{\Lambda\Lambda}(\vec{r}) & V_{\Sigma\Sigma}^{\Lambda\Lambda}(\vec{r}) \\ V_{\Lambda\Lambda}^{\Xi N}(\vec{r}) & V_{\Xi N}^{\Xi N}(\vec{r}) & V_{\Sigma\Sigma}^{\Xi N}(\vec{r}) \\ V_{\Lambda\Lambda}^{\Sigma\Sigma}(\vec{r}) & V_{\Xi N}^{\Sigma\Sigma}(\vec{r}) & V_{\Sigma\Sigma}^{\Sigma\Sigma}(\vec{r}) \end{pmatrix} \begin{pmatrix} R^{\Lambda\Lambda}(\vec{r}, t) \\ R^{\Xi N}(\vec{r}, t) \\ R^{\Sigma\Sigma}(\vec{r}, t) \end{pmatrix}$$

Truncation of $\Sigma\Sigma$ channel

► *Reduced coupled channel equation*

$$\begin{pmatrix} (E^{\Lambda\Lambda} - H_0^{\Lambda\Lambda}) R^{\Lambda\Lambda}(\vec{r}, t) \\ (E^{\Xi N} - H_0^{\Xi N}) R^{\Xi N}(\vec{r}, t) \end{pmatrix} = \begin{pmatrix} \overline{V}_{\Lambda\Lambda}^{\Lambda\Lambda}(\vec{r}) & \overline{V}_{\Xi N}^{\Lambda\Lambda}(\vec{r}) \\ \overline{V}_{\Lambda\Lambda}^{\Xi N}(\vec{r}) & \overline{V}_{\Xi N}^{\Xi N}(\vec{r}) \end{pmatrix} \begin{pmatrix} R^{\Lambda\Lambda}(\vec{r}, t) \\ R^{\Xi N}(\vec{r}, t) \end{pmatrix}$$

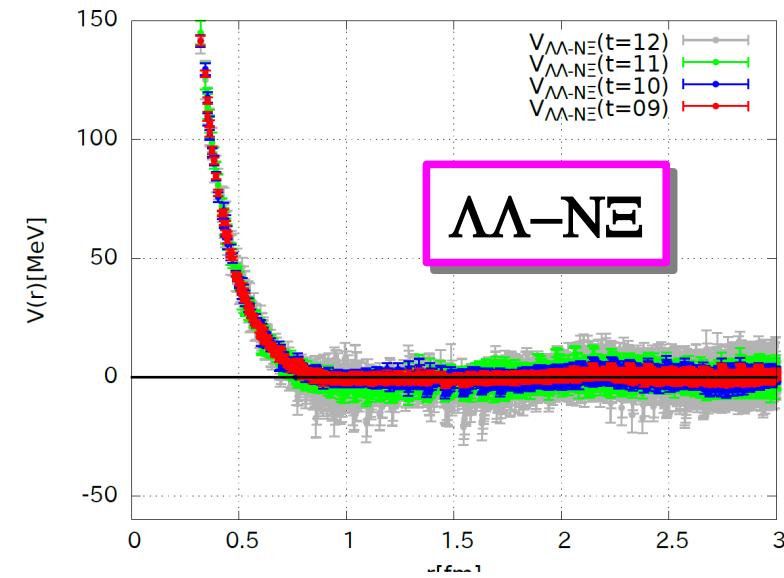

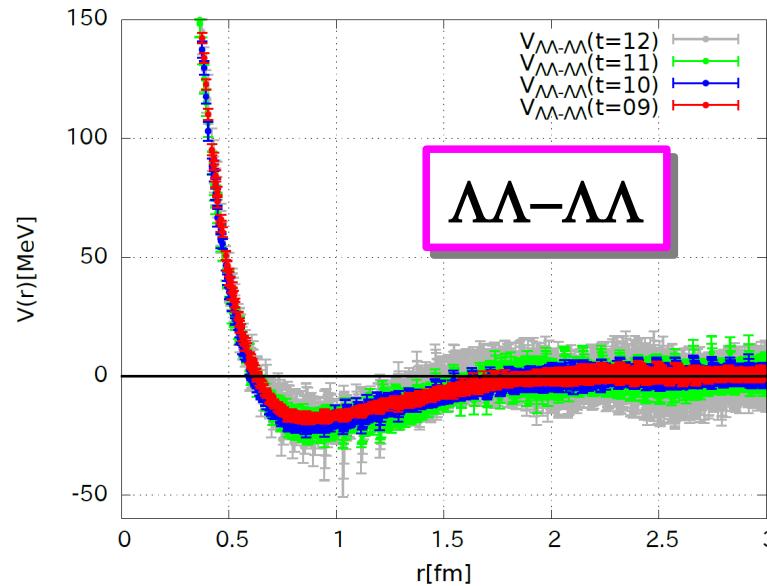

Effective $\Lambda\Lambda$ - ΞN potential

- The same scattering phase shift would be expected in a low energy region.
- Non-locality (energy dependence, higher derivative contribution)
of potential matrix could be enhanced.

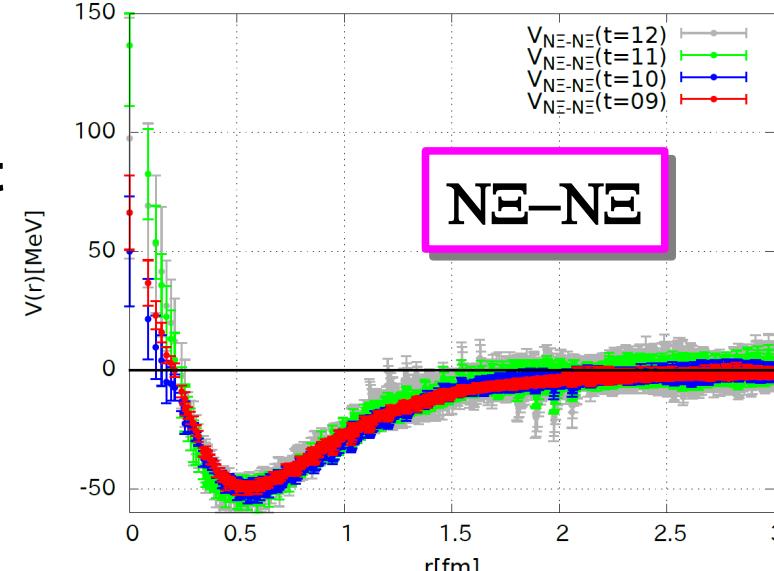

$\Lambda\Lambda$, $N\Xi$ ($I=0$) 1S_0 potential (2ch calc.)

► $N_f = 2+1$ full QCD with $L = 8.1\text{fm}$, $m\pi = 146 \text{ MeV}$

Preliminary!

- Potential calculated by only using $\Lambda\Lambda$ and $N\Xi$ channels.
- Long range part of potential is almost stable against the time slice.
- Short range part of $N\Xi$ potential changes as time t goes.
- $\Lambda\Lambda$ - $N\Xi$ transition potential is quite small in $r > 0.7\text{fm}$ region

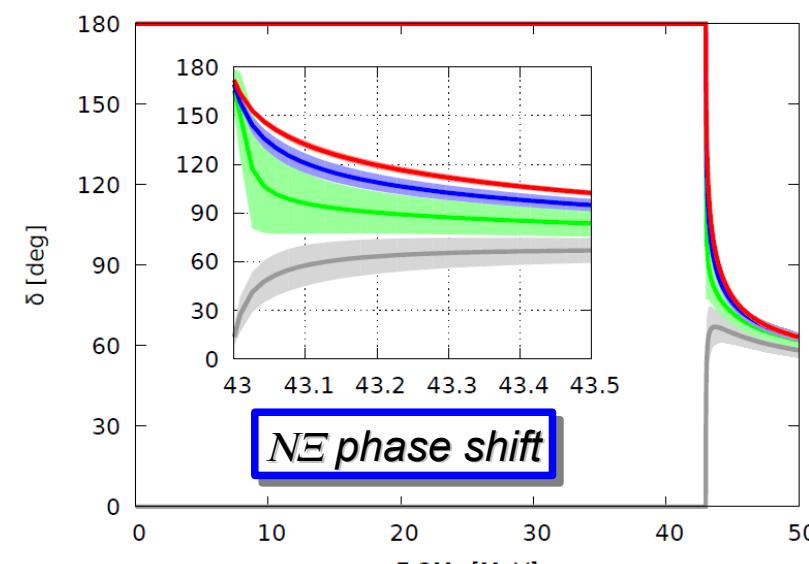

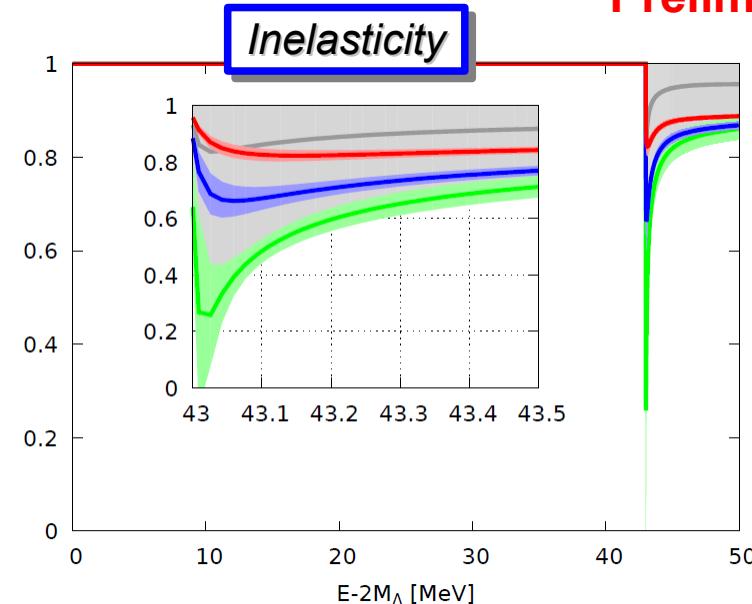

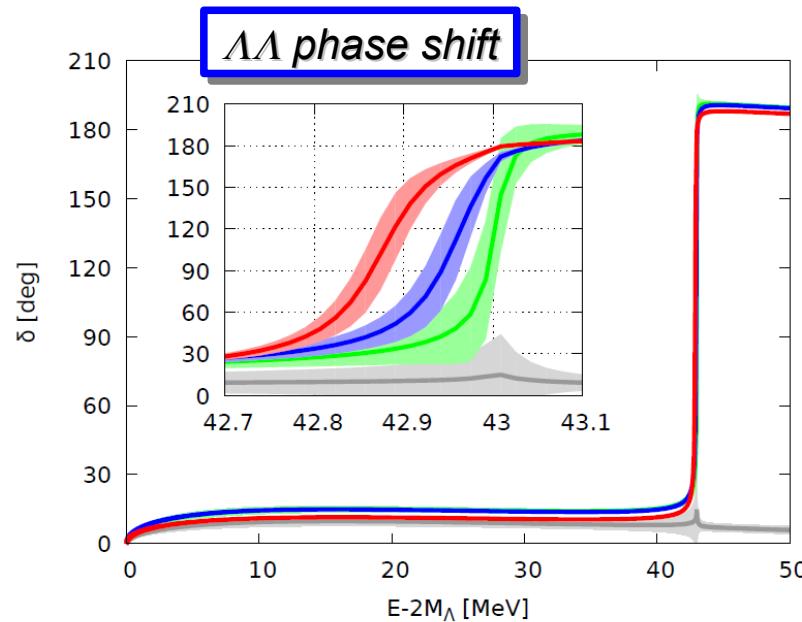

$t=09$
 $t=10$
 $t=11$
 $t=12$

$\Lambda\Lambda$ and $N\Xi$ phase shift and inelasticity

► $N_f = 2+1$ full QCD with $L = 8.1\text{fm}$, $m\pi = 146\text{ MeV}$

Preliminary!

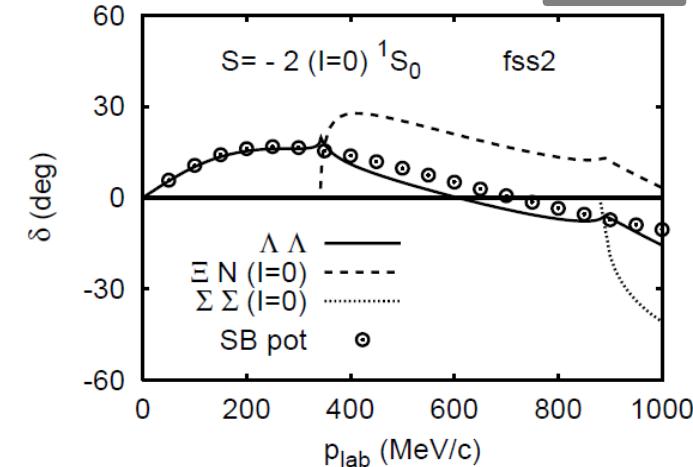

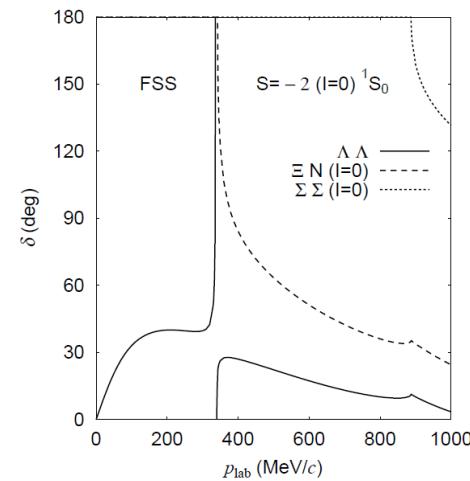

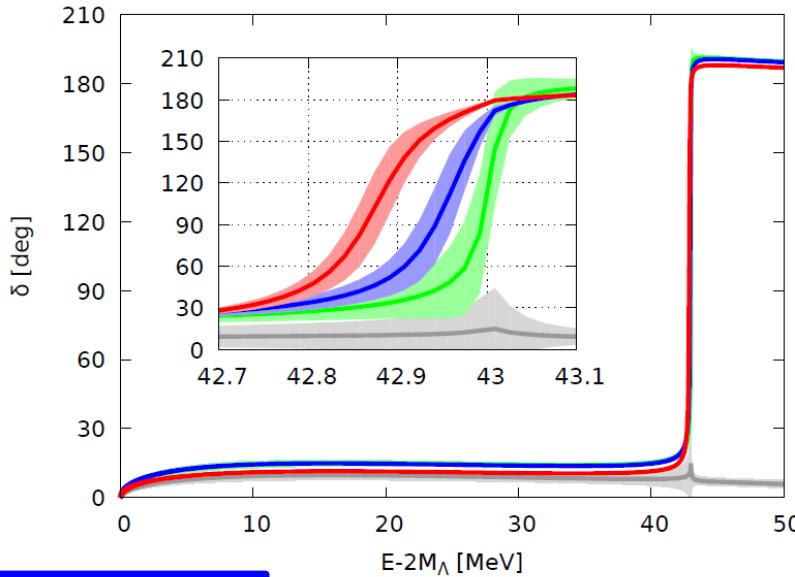

- $\Lambda\Lambda$ and $N\Xi$ phase shift is calculated by using 2ch effective potential.
- A sharp resonance is found below the $N\Xi$ threshold for $t < 12$.

$t=09$
 $t=10$
 $t=11$
 $t=12$

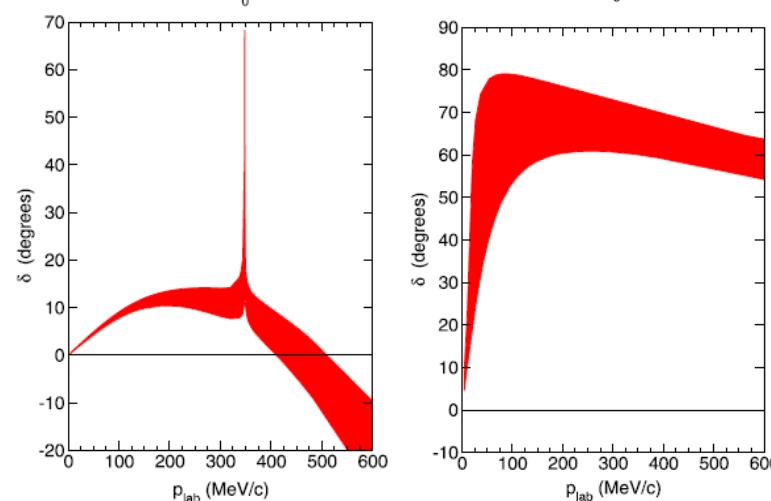

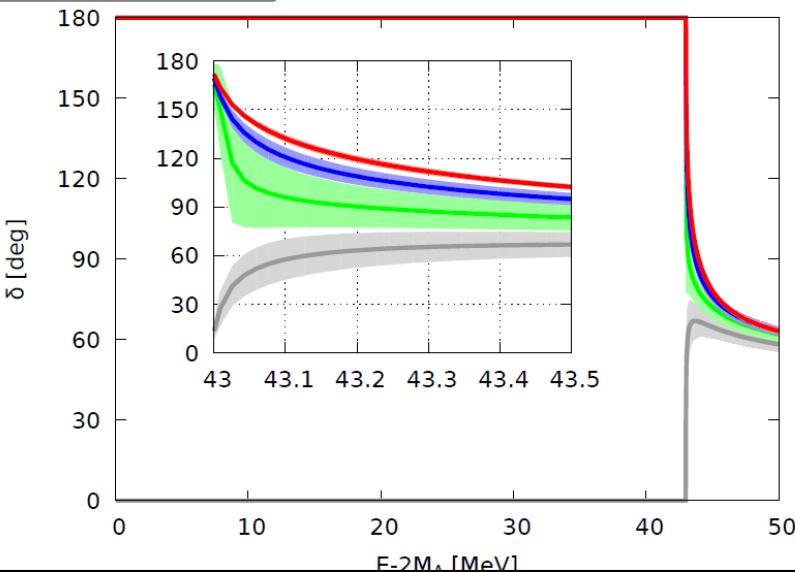

$\Lambda\Lambda$ and $N\Xi$ phase shift –comparison--

$\Lambda\Lambda$ phase shift

Y.Fujiwara et al, PPNP58(2007)439

$N\Xi$ phase shift

J. Haidenbauer et al, NPA954(2016)273

● Our results are compatible
with the phenomenological ones.

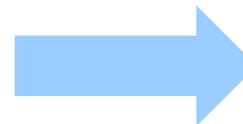

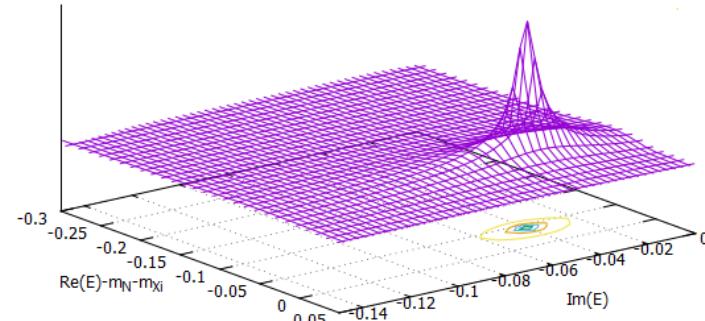

t=09
t=10
t=11

Resonance energy and width

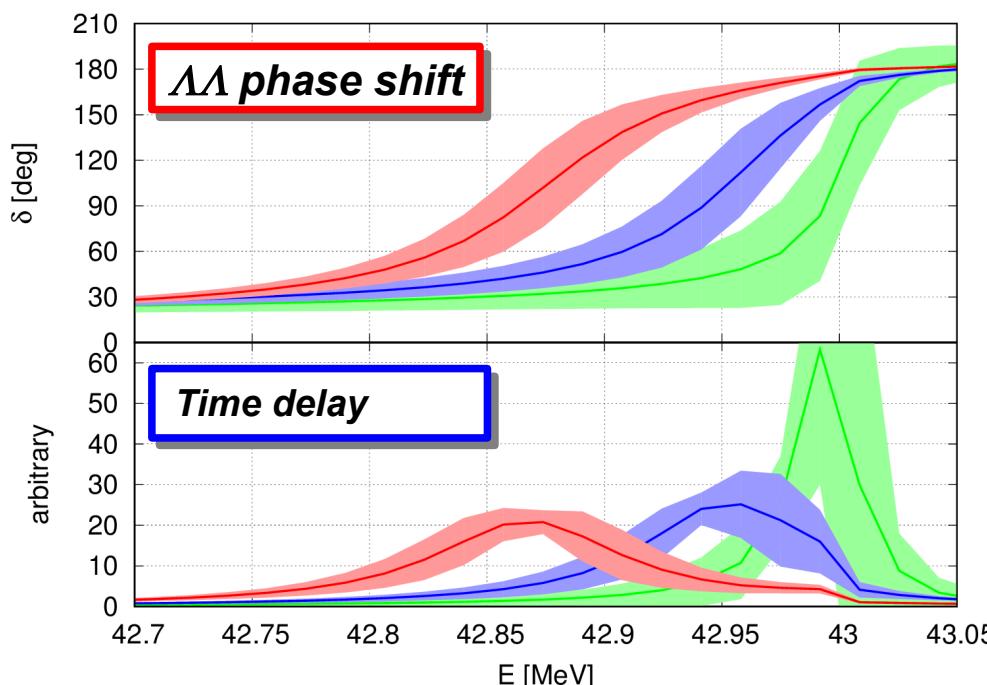

► **N_f = 2+1 full QCD with L = 8.1fm, m_π = 146 MeV**

Pole in t-matrix

Preliminary!

Energy and Width

Time delay

● In the vicinity of resonance point,

$$\delta(E) = \delta_B - \arctan\left(\frac{\Gamma/2}{E - E_r}\right)$$

thus

$$\frac{d\delta(E)}{dE} = \frac{\Gamma/2}{(E - E_r)^2 + (\Gamma/2)^2}$$

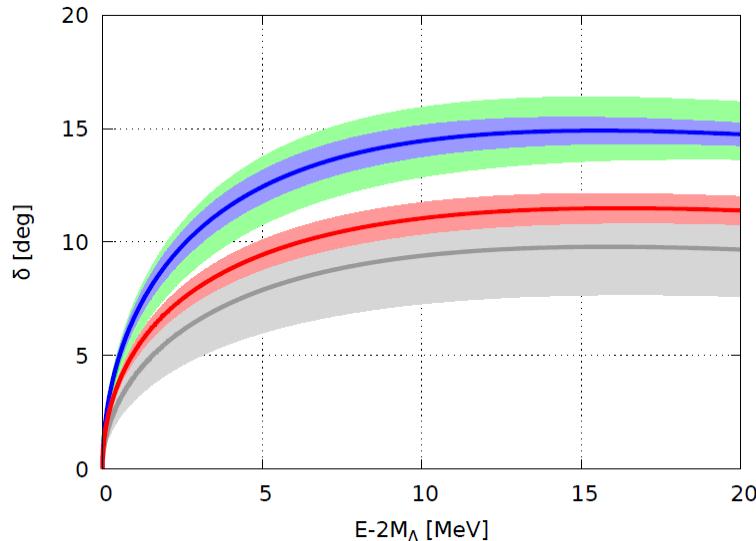

$t=09$
 $t=10$
 $t=11$
 $t=12$

$\Lambda\Lambda$ scattering length

Phase shift

Preliminary!

$$-1.25 < a_{\Lambda\Lambda} < -0.56 \text{ fm}$$

$$a_{\Lambda\Lambda} = -0.821 \text{ fm}$$

$$a_{\Lambda\Lambda} = -0.97 \text{ fm}$$

K.Morita et al, PRC91 (2015)024916

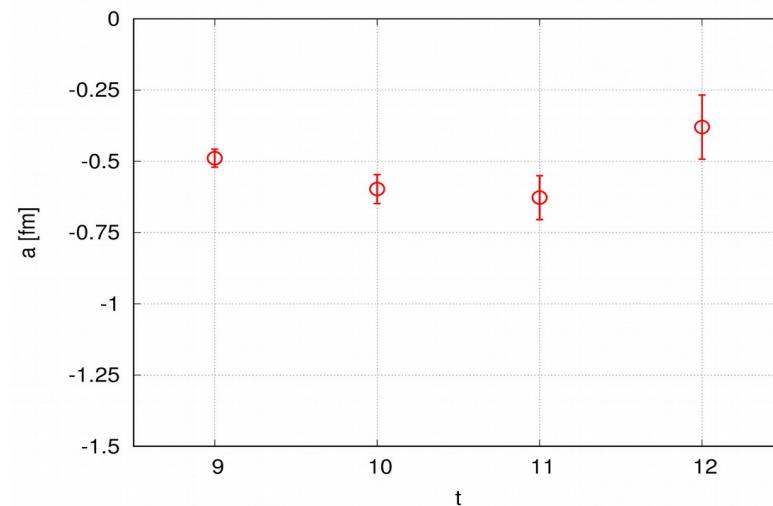

Y.Fujiwara et al, PPNP58(2007)439

Th.A.Rijken et al, Few-Body Syst 54(2013)801

Λ	550	600	650	700
$a_{1S0}^{\Lambda\Lambda}$	-1.52	-1.52	-1.54	-1.67
$r_{1S0}^{\Lambda\Lambda}$	0.82	0.59	0.31	0.34

H. Polinder et al, PLB653(2007)29

Scattering length

- Scattering length in $\Lambda\Lambda$ ($I=0$) channel is not saturated.
- Attraction is weaker than the phenomenological one.

Summary

- ▶ We have investigated coupled channel baryonic interactions from lattice QCD.
- ▶ We find that
 - Potential in $\Lambda\Lambda$ 1S_0 channel is weakly attractive.
 - $N\Xi$ potential is largely depends on its channel.
 - Potential in flavor singlet 1S_0 channel is strongly attractive.
- ▶ We have studied dibaryon candidate states
 - H-dibaryon channel
 - We perform $\Lambda\Lambda$ - $N\Xi$ coupled channel calculation.
 - Sharp resonance is found just below the $N\Xi$ threshold in relatively small “t” region.
(Time slice saturation is not achieved yet.)
 - ● Fate of H-dibaryon...
- We continue to study it by using higher statistical data.
