Cosmological attractor

- ❖ Cosmic strings
- ❖ Cosmological evolution
- ❖ Scaling of the energy density

Loop distribution

Stochastic GW

Conclusion

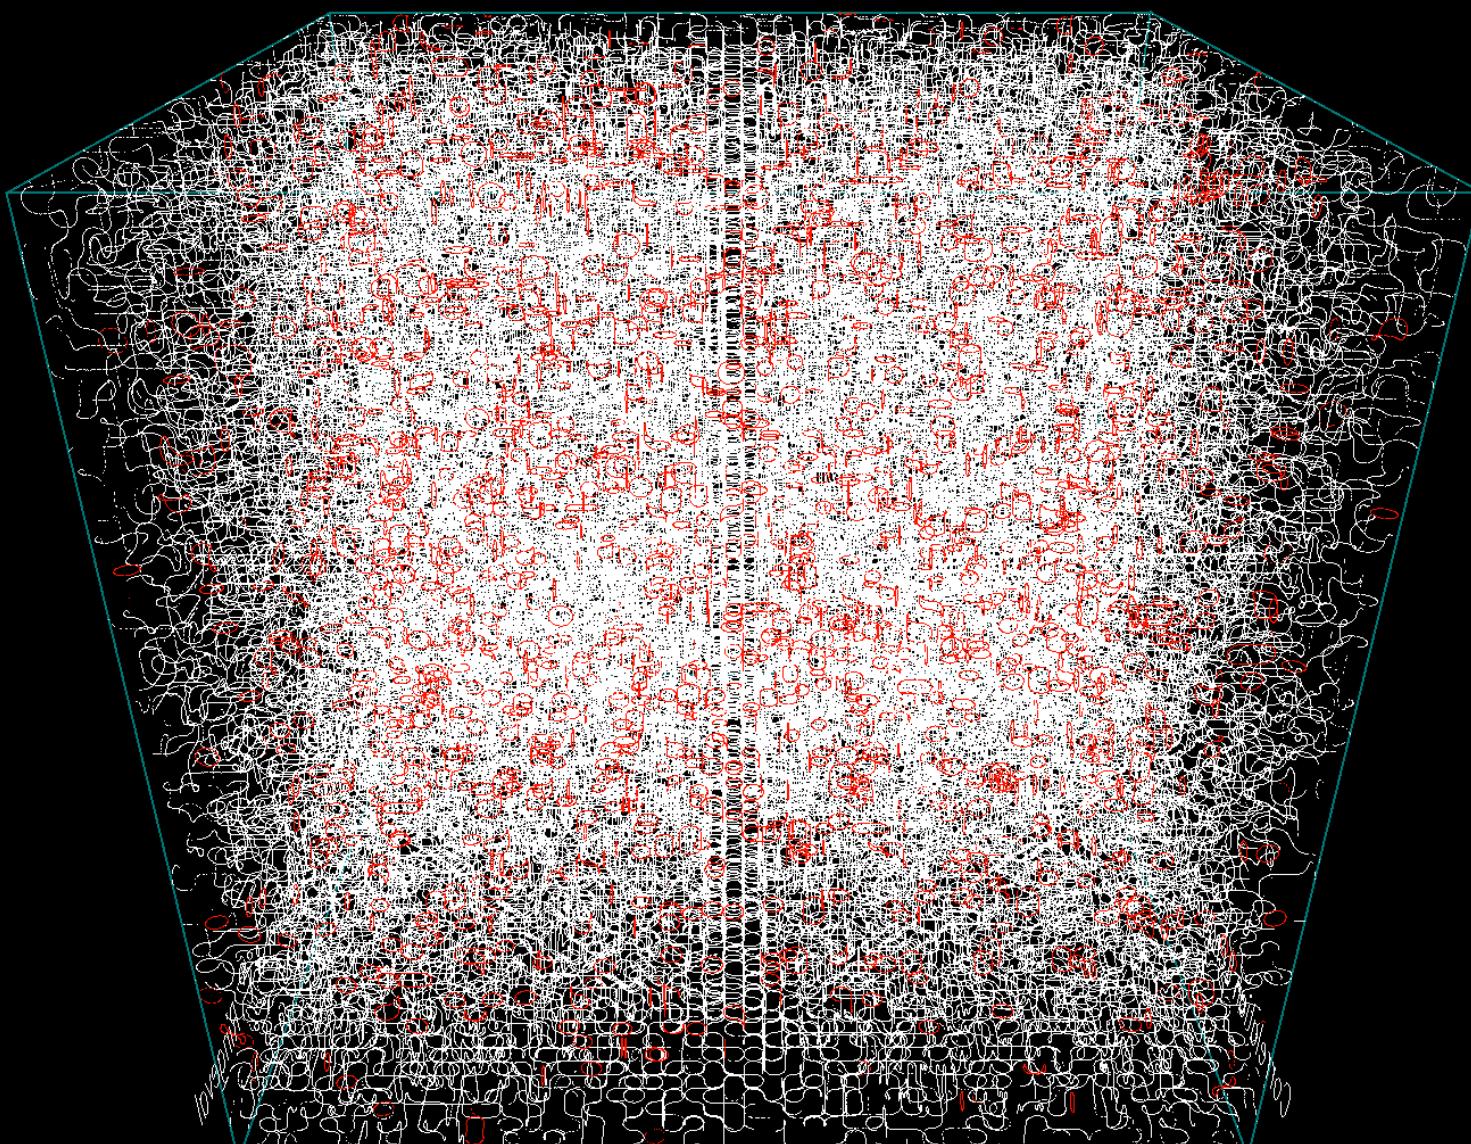

- Topological defects
  - ◆ Global strings [Davis:1985, Durrer:1998rw, Yamaguchi:1999yp]
  - ◆ Non-Abelian strings [Vilenkin:1984rt, Dvali:1993qp, Spergel:1996ai, Bucher:1998mh, McGraw:1998]
  - ◆ K- and DBI-strings [Babichev:2006cy, Babichev:2007tn, Sarangi:2007mj]
  - ◆ Current-carrying strings [Witten:1984eb, Davis:1988ip, Carter:1989dp, Peter:1992dw, Peter:1992ta]
- Line-like energy density distributions
  - ◆ Semi-local strings: energetically favoured for  $m_b > m_h$  [Vachaspati:1991, Hindmarsh:1991jq, Achucarro:1999it]
  - ◆ Cosmic superstrings: bound states made of  $p$  F-strings and  $q$  D1-brane [Witten:1985fp, Copeland:2009ga, Sakellariadou:2008ie, Polchinski:2004ia, Davis:2008dj]
  - ◆ Nambu–Goto strings: Lorentz invariant two-dimensional worldsheet [Goto:1971ce, Nambu:1974]
  - ◆ Carter strings [Carter:1989xk, Carter:1992vb, Carter:1994zs, Carter:2000wv]
- Simplest: Nambu–Goto strings, one parameter:  $\textcolor{red}{U}$

$$S = -\textcolor{red}{U} \int d\tau d\sigma \sqrt{-\gamma}, \quad \gamma_{ab} = g_{\mu\nu} X_{,a}^\mu X_{,b}^\nu \text{ (induced metric)}$$

# Cosmological evolution

Comoving Box Size: 1

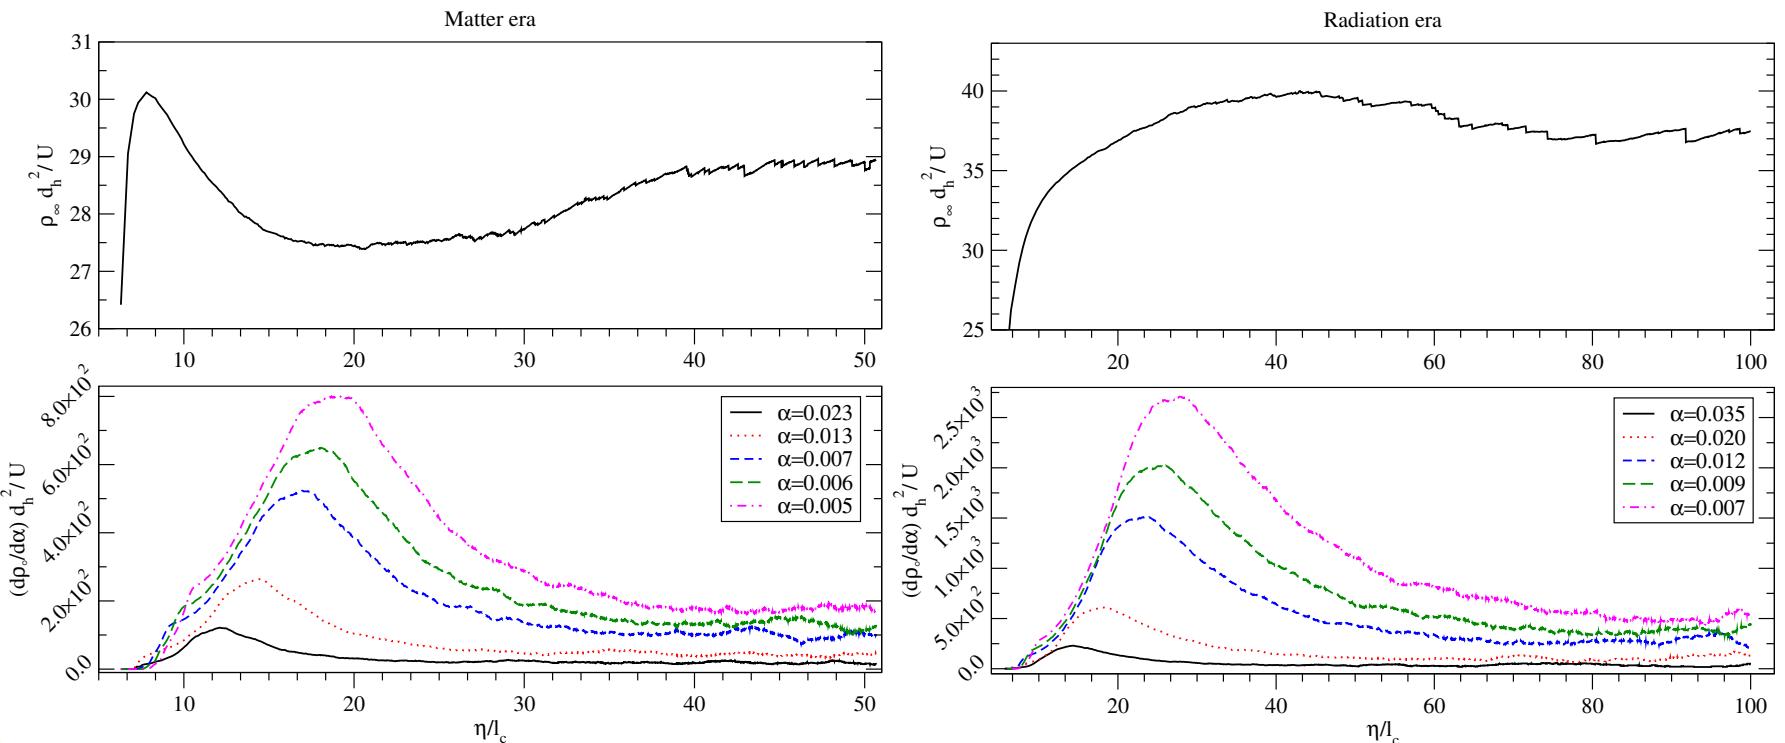

Hubble scale: 0.1230

4 / 18

# Scaling of the energy density

- Scaling of the energy densities for loops and long strings

[Ringeval:2005kr, Blanco-Pillado:2013qja]

$$\rho_{\text{inf}} \frac{d_h^2}{U} \Big|_{\text{mat}} = 28.4 \pm 0.9$$

$$\rho_{\text{inf}} \frac{d_h^2}{U} \Big|_{\text{rad}} = 37.8 \pm 1.7$$

$$d\rho_o \times \frac{d_h^2}{U} = \mathcal{S}(\alpha) \quad (\text{time independent})$$

# Scaling of the loop distribution

- By the end of the run

Cosmological attractor

Loop distribution

❖ Scaling of the loop distribution

❖ Polchinski-Rocha model

❖ GW emission and backreaction

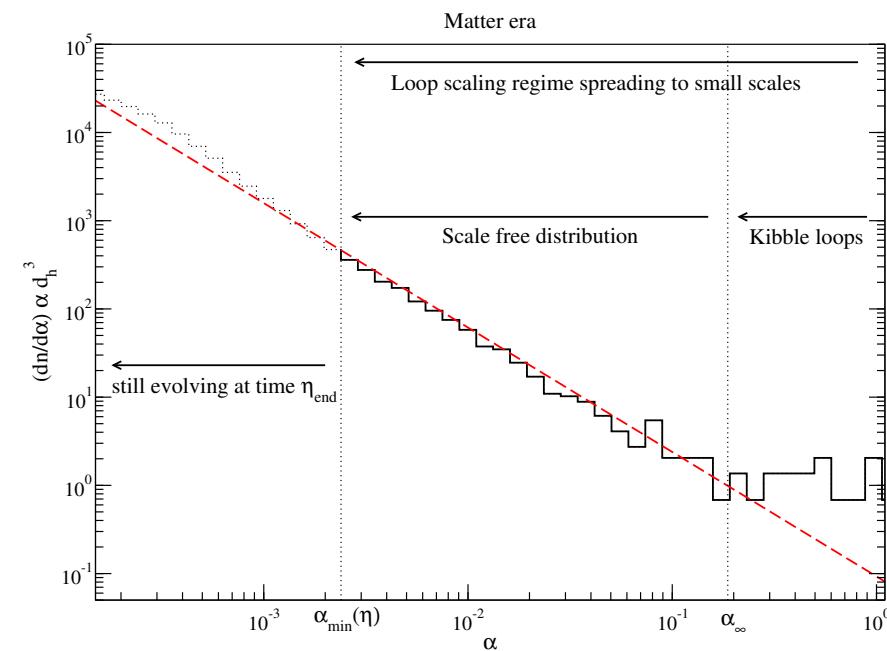

❖ Cosmological attractor

Stochastic GW

Conclusion

## Scaling parts

- Scaling form  $S(\alpha) = \frac{C_0}{\alpha^p}$  with

$$\begin{cases} p &= 1.41^{+0.08}_{-0.07} \\ C_0 &= 0.09^{-0.03}_{+0.03} \end{cases}$$

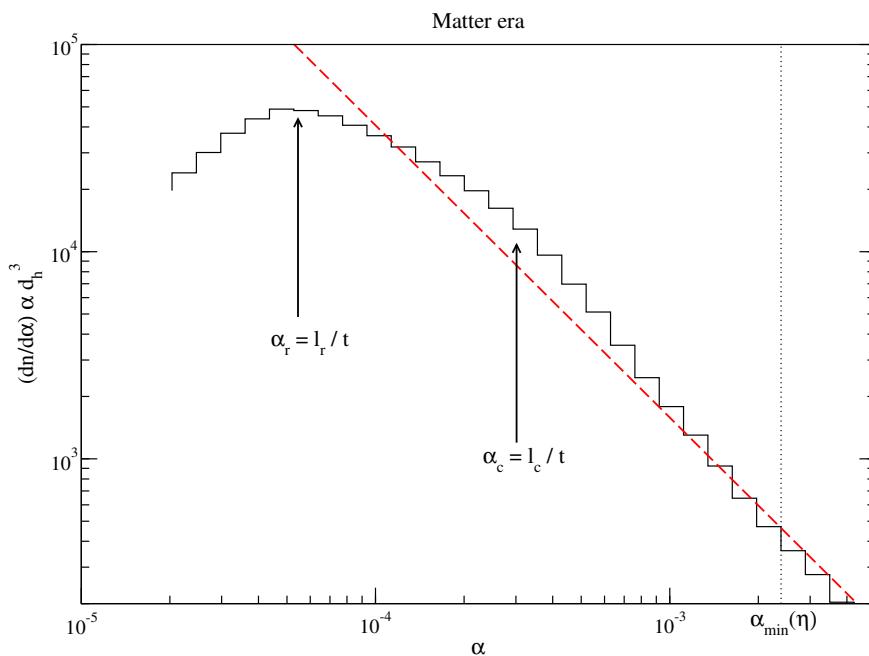

and

$$\begin{cases} p &= 1.60^{+0.21}_{-0.15} \\ C_0 &= 0.21^{-0.12}_{+0.13} \end{cases}$$

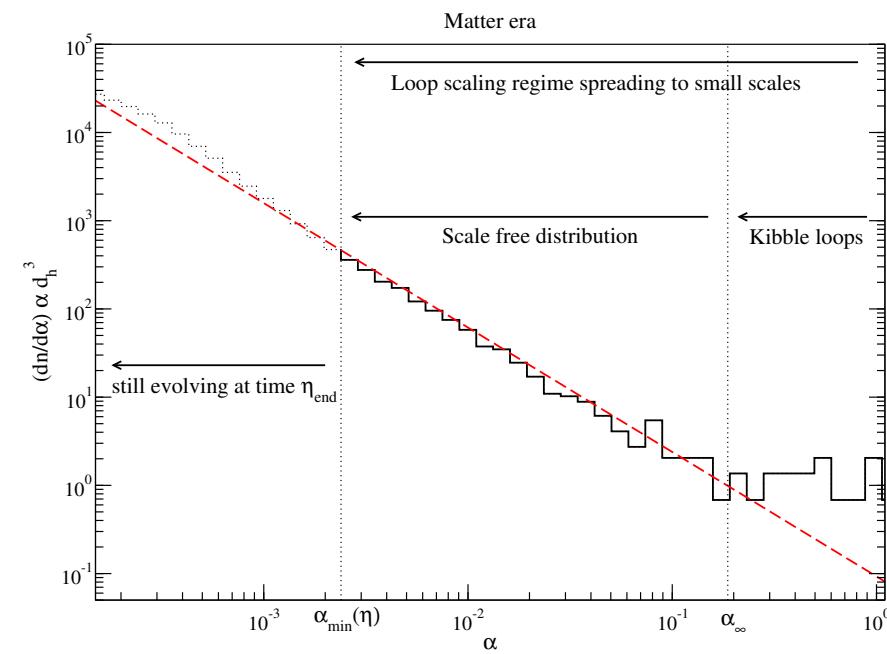

# Scaling of the loop distribution

- By the end of the run

## Non-scaling parts

## Scaling parts

- Scaling form  $S(\alpha) = \frac{C_0}{\alpha^p}$  with

$$\begin{cases} p &= 1.41^{+0.08}_{-0.07} \\ C_0 &= 0.09^{+0.03}_{-0.03} \end{cases}$$

and

$$\begin{cases} p &= 1.60^{+0.21}_{-0.15} \\ C_0 &= 0.21^{+0.13}_{-0.12} \end{cases}$$

# Polchinski-Rocha model

Cosmological attractor

Loop distribution

❖ Scaling of the loop distribution

❖ Polchinski-Rocha model

❖ GW emission and backreaction

❖ Cosmological attractor

Stochastic GW

Conclusion

- No fragmentation, no reconnection, loops from long string only

[Polchinski:2006ee,Dubath:2007mf,Rocha:2007ni]

- ◆ Predicts a power law scaling function

$$\mathcal{S}(\alpha) \propto \alpha^{2\chi-2} \implies p = 2(1-\chi)$$

- ◆ Parameter  $\chi$  is related to two-point functions [Hindmarsh:2008dw]

$$\left\langle \dot{X}^A(\sigma) \dot{X}^B(\sigma') \right\rangle = \frac{1}{2} \delta^{AB} T(\sigma - \sigma') \quad T(\sigma) \simeq \bar{t}^2 - c_1 \left( \frac{\sigma}{\hat{\xi}} \right)^{2\chi}$$

- Agreement with simulations suggests that all neglected effects mostly renormalise  $C_\circ$  but not  $\chi$
- ⇒ use the PR model to understand the loop distribution down to the length scales unreachable with numerical simulations
- + Boltzmann equation...

# Including loop's gravitational radiation

Cosmological attractor

Loop distribution

- ❖ Scaling of the loop distribution

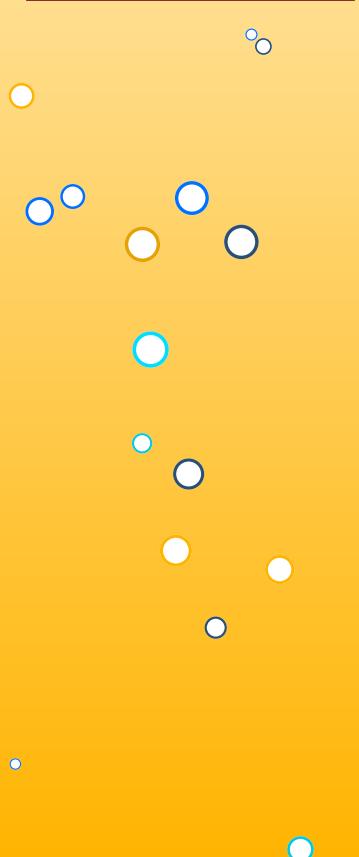

- ❖ Polchinski-Rocha model

- ❖ GW emission and backreaction

- ❖ Cosmological attractor

Stochastic GW

Conclusion

- Boltzmann equation + PR production function
  - ◆ PR loop production function (from string shape correlations)

$$t^5 \mathcal{P}(\ell, t) = c \left( \frac{\ell}{t} \right)^{2\chi-3}$$

- ◆ In an expanding universe

$$\frac{d}{dt} \left( a^3 \frac{dn}{d\ell} \right) = a^3 \mathcal{P}(\ell, t)$$

- ◆ A loop shrinks due to GW emission ( $\gamma \equiv \ell/t$ ) [Allen:1992]

$$\frac{d\ell}{dt} = -\gamma_d \simeq 50 GU$$

- Evolution equation [Rocha:2007ni, Lorenz:2010sm]

$$\frac{\partial}{\partial t} \left( a^3 \frac{dn}{d\ell} \right) - \gamma_d \frac{\partial}{\partial \ell} \left( a^3 \frac{dn}{d\ell} \right) = a^3 \mathcal{P}(\ell, t)$$

# Inclusion of gravitational backreaction

Cosmological attractor

Loop distribution

❖ Scaling of the loop distribution

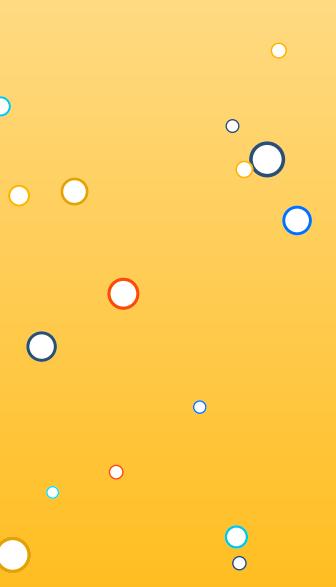

❖ Po~~ch~~chinski-Rocha model

❖ GW emission and backreaction

❖ Cosmological attractor

Stochastic GW

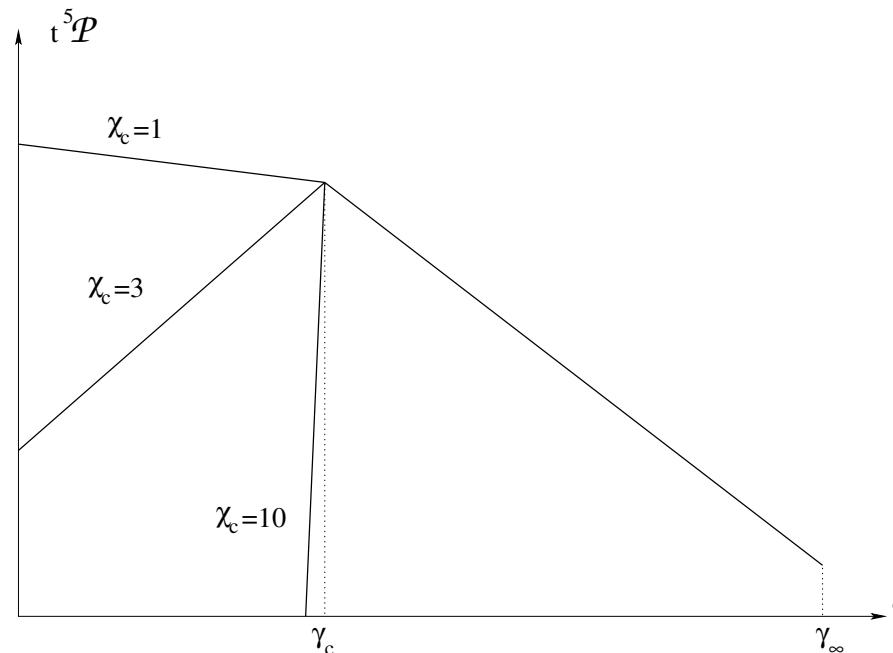

Conclusion

- PR model + GW emission + GW backreaction [Lorenz:2010sm]

◆ GW backreaction:  $\gamma_c \simeq 20(GU)^{1+2\chi}$  [Polchinski:2007]

◆ Postulated piecewise scaling loop production function

$$t^5 \mathcal{P} \left( \gamma = \frac{\ell}{t}, t \right) \propto \gamma^{2\chi - 3}$$

$$\gamma_c \ll \gamma_d \ll \gamma_\infty \lesssim 1$$

- Allows us to extrapolate numerical simulations to small  $\ell$
- Boltzmann equation can be completely solved analytically (see arXiv.1006.0931)

❖ Cosmological attractor

Stochastic GWO

Conclusion

- From any initial loop distribution  $\mathcal{N}_{\text{ini}}(\ell)$ , one gets  $\mathcal{F}(\gamma, t) \equiv \frac{dn}{d\ell}(\gamma, t)$
- Scaling attractor does not depend on  $\mathcal{N}_{\text{ini}}$  nor on GW backreaction details

$$t^4 \mathcal{F}(\gamma \geq \gamma_c, t) = \left( \frac{t}{t_{\text{ini}}} \right)^4 \left( \frac{a_{\text{ini}}}{a} \right)^3 t_{\text{ini}}^4 \mathcal{N}_{\text{ini}} \left\{ \left[ \gamma + \gamma_d \left( 1 - \frac{t_{\text{ini}}}{t} \right) \right] t \right\} + C(\gamma + \gamma_d)^{2\chi-3} f \left( \frac{\gamma_d}{\gamma + \gamma_d} \right) \\ - C(\gamma + \gamma_d)^{2\chi-3} \left( \frac{t}{t_{\text{ini}}} \right)^{2\chi+1} \left( \frac{a_{\text{ini}}}{a} \right)^3 f \left( \frac{\gamma_d}{\gamma + \gamma_d} \frac{t_{\text{ini}}}{t} \right),$$

$$t^4 \mathcal{F}(\gamma_\tau \leq \gamma < \gamma_c, t) = \left( \frac{t}{t_{\text{ini}}} \right)^4 \left( \frac{a_{\text{ini}}}{a} \right)^3 t_{\text{ini}}^4 \mathcal{N}_{\text{ini}} \left\{ \left[ \gamma + \gamma_d \left( 1 - \frac{t_{\text{ini}}}{t} \right) \right] t \right\} + C_c(\gamma + \gamma_d)^{2\chi_c-3} f_c \left( \frac{\gamma_d}{\gamma + \gamma_d} \right) \\ - C(\gamma + \gamma_d)^{2\chi-3} \left( \frac{t}{t_{\text{ini}}} \right)^{2\chi+1} \left( \frac{a_{\text{ini}}}{a} \right)^3 f \left( \frac{\gamma_d}{\gamma + \gamma_d} \frac{t_{\text{ini}}}{t} \right) \\ + K \left( \frac{\gamma_c + \gamma_d}{\gamma + \gamma_d} \right)^4 \left[ \frac{a \left( \frac{\gamma + \gamma_d}{\gamma_c + \gamma_d} t \right)}{a(t)} \right]^3,$$

$$t^4 \mathcal{F}(0 < \gamma < \gamma_\tau, t) = \left( \frac{t}{t_{\text{ini}}} \right)^4 \left( \frac{a_{\text{ini}}}{a} \right)^3 t_{\text{ini}}^4 \mathcal{N}_{\text{ini}} \left\{ \left[ \gamma + \gamma_d \left( 1 - \frac{t_{\text{ini}}}{t} \right) \right] t \right\} + C_c(\gamma + \gamma_d)^{2\chi_c-3} f_c \left( \frac{\gamma_d}{\gamma + \gamma_d} \right)$$

$$\gamma_\tau(t) \equiv (\gamma_c + \gamma_d) \frac{t_{\text{ini}}}{t} - \gamma_d, \quad \mu \equiv 3\nu - 2\chi - 1$$

$$f(x) \equiv {}_2F_1(3 - 2\chi, \mu; \mu + 1; x) \quad f_c(x) \equiv {}_2F_1(3 - 2\chi_c, \mu_c; \mu_c + 1; x)$$

dependency

❖ Microstructure effects

Conclusion

- Leading order for a loop of  $T = \ell/2$ , frequency  $\varpi_n = 2\pi n/T$

$$\bar{h}_{\text{b}}^{\mu\nu}(\varpi_n, |\mathbf{r}| \hat{\mathbf{n}}) = \frac{GU}{T} \frac{e^{i\varpi_n |\mathbf{r}|}}{|\mathbf{r}|} C^{\mu\nu}, \quad C^{\mu\nu} \equiv I_+^\mu I_-^\nu + I_+^\nu I_-^\mu$$

$$I_\epsilon^\mu \equiv \int d\sigma_\epsilon \exp\left(\frac{i\varpi_n \sigma_\epsilon}{2} - \frac{i\varpi_n \hat{\mathbf{n}} \cdot \mathbf{X}_\epsilon}{2}\right) \frac{dX_\epsilon^\mu}{d\sigma_\epsilon}$$

- Maximal GW emission when [Damour&Vilenkin:2001]

- ◆ Both  $I_\pm^\mu$  have saddle points:  $\hat{\mathbf{n}} = \dot{\mathbf{X}}_+ = \dot{\mathbf{X}}_- \Rightarrow \text{cusp}$

$$\Omega_{\text{beam}} = \pi \theta_{\text{beam}}^2 = \pi \left( \frac{8\pi}{\sqrt{3}\varpi\ell} \right)^{2/3}, \quad C^{\mu\nu} \propto \varpi^{-4/3}$$

- ◆ One  $I_\pm^\mu$  has a saddle point and  $\dot{\mathbf{X}}_\mp$  discontinuous  $\Rightarrow \text{kink}$

$$\Omega_{\text{beam}} = 2\pi \theta_{\text{beam}}, \quad C^{\mu\nu} \propto \varpi^{-5/3}$$

- ◆ Both  $\dot{\mathbf{X}}_\pm$  are discontinuous: two kinks collide

$$\Omega_{\text{beam}} = 4\pi, \quad C^{\mu\nu} \propto \varpi^{-2}$$

Conclusion

- Time-averaged GW strain power [ $k = (\omega, \omega \hat{n})$ ] for one loop

$$\bar{h}_c^2(\omega, \ell, z) = \left[ \frac{GU(1+z)}{\chi(z)} \right]^2 \bar{\mathcal{C}}^2 [k(1+z)] \Theta[\omega - \omega_1(\ell, z)]$$

$$\bar{\mathcal{C}}^2 \equiv C_{\alpha\beta}^* C^{\alpha\beta} - \frac{1}{2} |C|^2$$

- Integrating over all loops

$$\Omega_{\text{sgw}}(\omega) = \frac{(GU)^2 \omega^3}{6\pi H_0^2} \iint dz d\ell \frac{dV}{dz} \frac{\mathcal{F}(\ell, z)}{\ell(1+z)} \Delta_{\text{beam}}(\omega, \ell, z)$$

$$\times \frac{(1+z)^2}{\chi^2(z)} \bar{\mathcal{C}}^2(\omega, \ell, z) \Theta[\omega - \omega_1(\ell, z)] \Theta[\bar{h}_*(\omega) - \bar{h}_c(\omega, \ell, z)]$$

where  $\bar{h}_*(\omega)$  is solution of:

$$\iint dz d\ell \frac{2}{(1+z)\ell} \frac{dV}{dz} \mathcal{F}(\ell, z) \Delta_{\text{beam}}(\omega, \ell, z) \Theta[\omega - \omega_1(\ell, z)]$$

$$\times \Theta[\bar{h}_c(\omega, \ell, z) - \bar{h}_*(\omega)] = \frac{\omega}{2\pi}$$

- Number of kinks and cusps is not known but:
  - ◆ Loop formation mechanism  $\Rightarrow N_{kk} = N_k^2/4$
  - ◆ Total radiated GW power  $< \Gamma G U^2$
  - ◆ For  $\Gamma = 50$  this yields:  $N_c \leq 11$     $N_k \leq 133$
- Three prototypical models
  - ◆ Model 2C:  $N_c = 2$ , no kinks (and no collisions)
  - ◆ Model LNK: Only kinks with  $N_k < 20$
  - ◆ Model HNK: Only kinks but  $20 \leq N_k \leq 133$
