

Beyond-mean-field theory for multi-octupole excitations in ^{208}Pb and subbarrier fusion of $^{16}\text{O} + ^{208}\text{Pb}$

Kouichi Hagino (Tohoku Univ.)

← J.M. Yao (Southwest U.

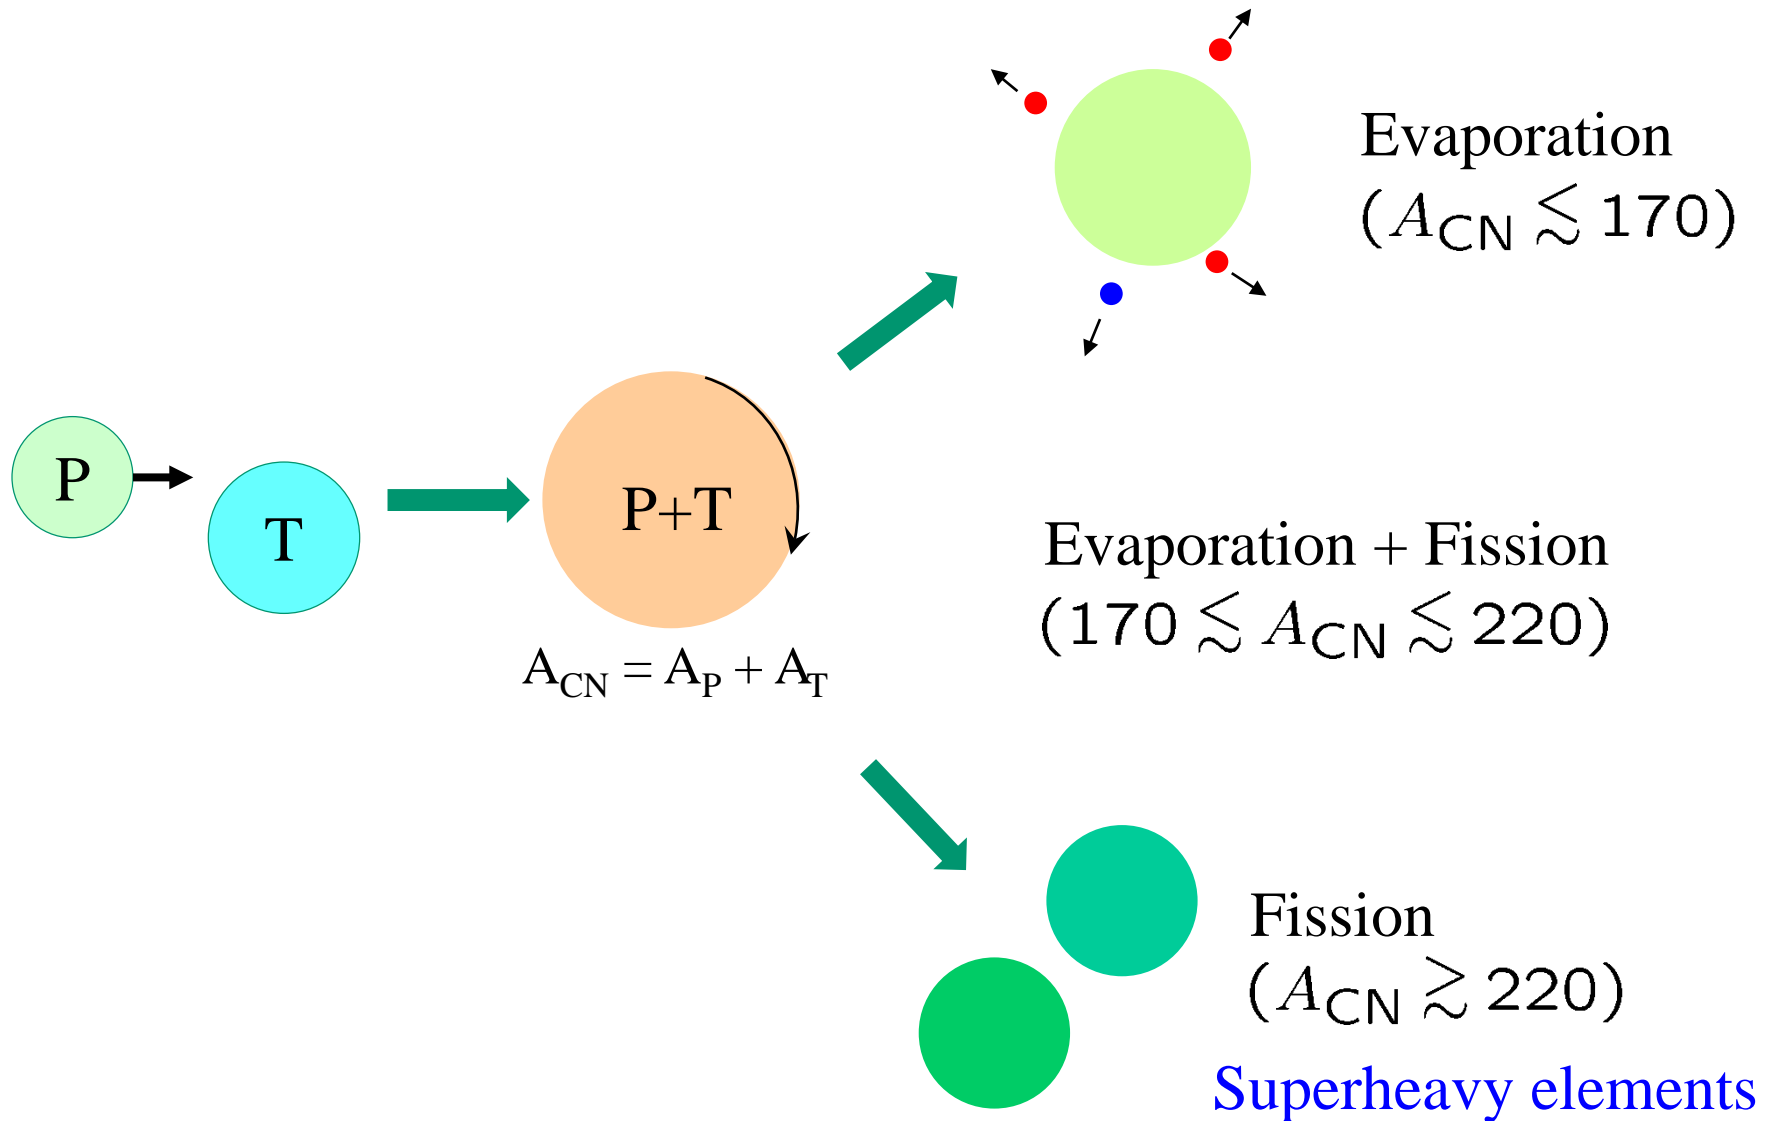

/ Tohoku → N.Carolina U.)

- 1. Introduction: Heavy-ion subbarrier fusion reactions*
- 2. Coupled-channels approach
with “beyond-mean-field” method*
- 3. Octupole excitations in fusion of $^{16}\text{O} + ^{208}\text{Pb}$*
- 4. Summary*

Introduction: Heavy-ion fusion reactions

Fusion: compound nucleus formation

Discovery of large sub-barrier enhancement of σ_{fus}

potential model: $V(r) + \text{absorption}$

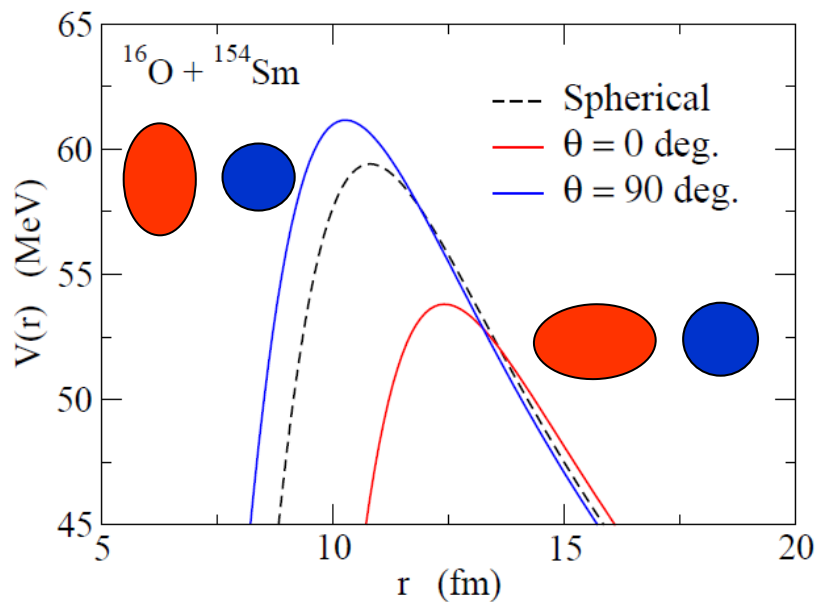

cf. seminal work:

R.G. Stokstad et al., PRL41('78) 465

Effect of nuclear deformation

^{154}Sm : a deformed nucleus with $\beta_2 \sim 0.3$

$$\sigma_{\text{fus}}(E) = \int_0^1 d(\cos \theta) \sigma_{\text{fus}}(E; \theta)$$

Fusion: strong interplay between nuclear structure and nuclear reaction

Strong target dependence
at $E < V_b$

Coupled-Channels method

Coupling between rel. and intrinsic motions

$$\Psi(\mathbf{r}, \xi) = \sum_k \psi_k(\mathbf{r}) \phi_k(\xi)$$

coupled Schrodinger equations for $\psi_k(\mathbf{r})$

C.C. approach: a standard tool for sub-barrier fusion reactions

cf. CCFULL (K.H., N. Rowley, A.T. Kruppa, CPC123 ('99) 143)

✓ Fusion barrier distribution (Rowley, Satchler, Stelson, PLB254('91))

$$D_{\text{fus}}(E) = \frac{d^2(E\sigma_{\text{fus}})}{dE^2}$$

— c.c. calculations

K.H., N. Takigawa, PTP128 ('12) 1061

Semi-microscopic modeling of sub-barrier fusion

K.H. and J.M. Yao, PRC91('15) 064606

multi-phonon excitations

simple harmonic oscillator

$$Q(2_1^+) = -10 \pm 6 e\text{fm}^2$$

Simple harmonic oscillator
: justifiable?

beyond mean-field approach
to account for anharmonicity

cf. GCM: large amplitude
collective motions

Self-consistent mean-field (Hartree-Fock) method:

- independent particles in a mean-field potential
- global theory for **the whole nuclear chart**
- intuitive picture for nuclear deformation
- optimized shape can be automatically determined

Mean-field approximation and beyond

Drawbacks of the mean-field approximation : nuclear spectrum

- ✓ body-fixed frame formalism → intuitive picture of nuclear def.
 - ✓ spectrum: lab-frame ← transformation from intrinsic to lab. frames
- nuclear spectrum: requires to go beyond the mean-field approximation

$$|\Psi_{IM}(\beta)\rangle = \hat{P}_{MK}^I \hat{P}^N \hat{P}^Z |\Psi_{MF}(\beta)\rangle$$

angular momentum + particle number projections

- ✓ quantum fluctuation

$$|\Phi_{IM}\rangle = \int d\beta f(\beta) |\Psi_{IM}(\beta)\rangle$$

generator coordinate method (GCM)

single → multi Slater determinants

□ Beyond MF: Illustration with ^{12}C : (GCM+PNP+AMP)

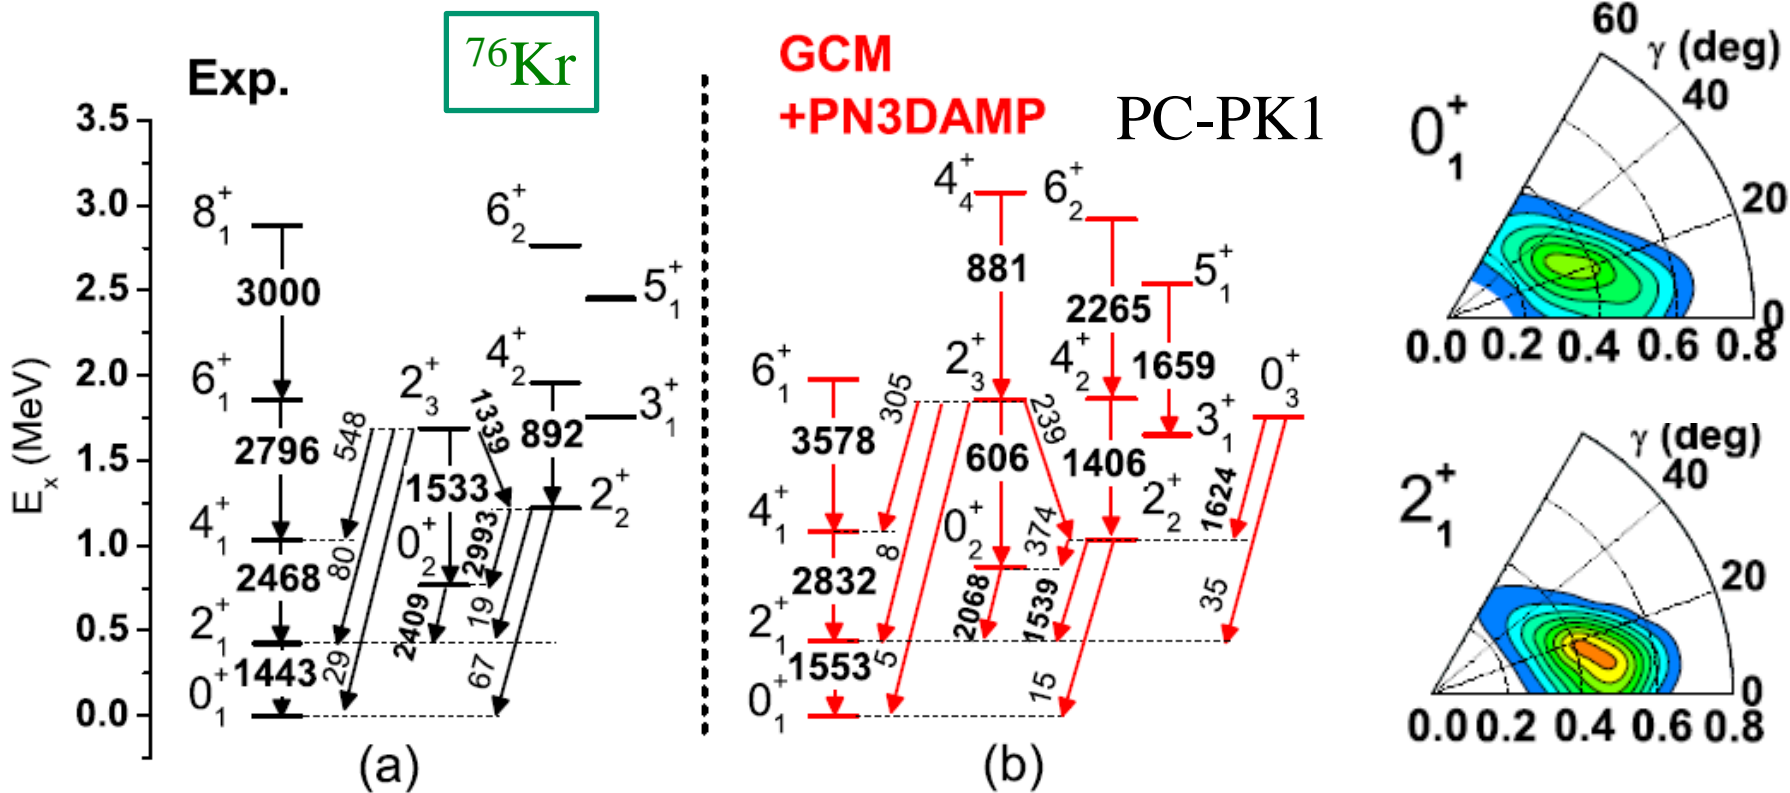

$$|\Phi_{IM_I}\rangle = \sum_{\beta} F^I(\beta) \hat{P}_{M_I K}^I \hat{P}^N \hat{P}^Z |\varphi(\beta)\rangle$$

➤ Low-lying spectrum is reproduced rather well.

beyond mean-field approximation

- ✓ angular momentum + particle number projections
- ✓ quantum fluctuation (GCM)

J.M. Yao, K.H., Z.P. Li, J. Meng, and P. Ring, PRC89 ('14) 054306

Recent beyond-MF (MR-DFT) calculations for ^{58}Ni

K.H. and J.M. Yao, PRC91 ('15) 064606

J.M. Yao, M. Bender, and P.-H. Heenen, PRC91 ('15) 024301

- ✓ A large fragmentation of $(2^+ \times 2^+)_{J=0}$
- ✓ A strong transition from 2_2^+ to 0_2^+

effects on sub-barrier fusion?

Semi-microscopic coupled-channels model for sub-barrier fusion

K.H. and J.M. Yao, PRC91 ('15) 064606

microscopic
multi-pole operator

$$V_{\text{coup}}(r, \xi) \sim F_{\lambda}(r) Q_{\lambda} \cdot Y_{\lambda}(\hat{r})$$

- ✓ $M(E2)$ from MR-DFT calculation ← among higher members of phonon states
- ✓ scale to the empirical $B(E2; 2_1^+ \rightarrow 0_1^+)$
- ✓ still use a phenomenological potential
- ✓ use the experimental values for E_x
- ✓ β_N and β_C from M_n/M_p for each transition
- ✓ axial symmetry (no 3^+ state)

$^{58}\text{Ni} + ^{58}\text{Ni}$

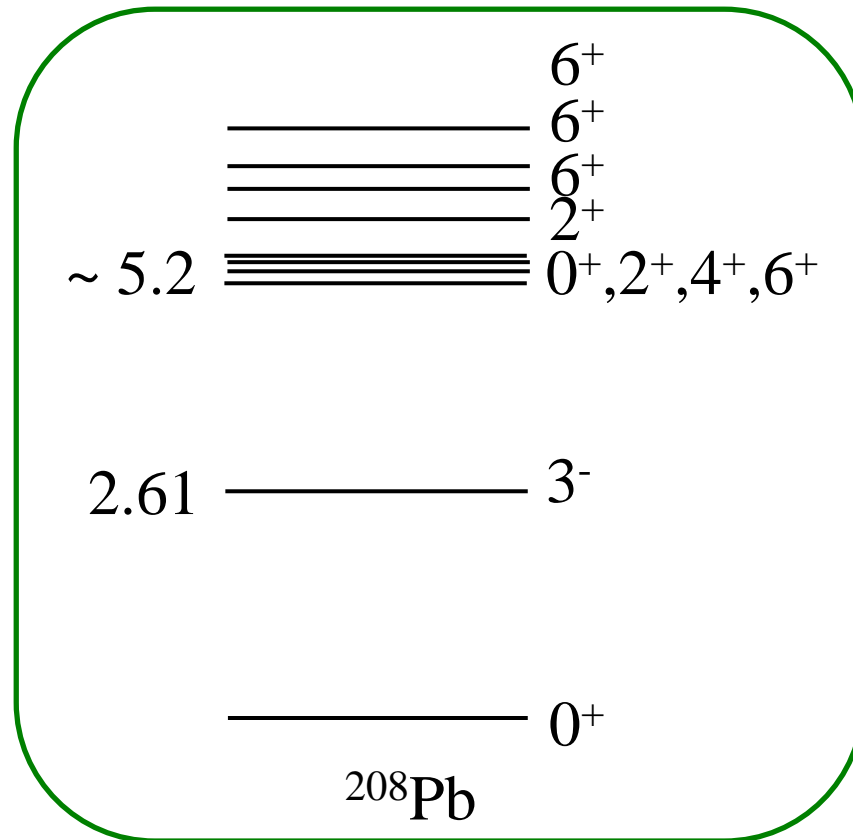

anharmonicity of 2^+ phonon
 \rightarrow only a minor improvement

Next, more non-trivial case
 with $2^+ - 3^-$ coupling:
 anharmonicity of oct. vib.
 in ^{208}Pb

Application to $^{16}\text{O} + ^{208}\text{Pb}$ fusion reaction

double-octupole phonon states in ^{208}Pb

M. Yeh, M. Kadi, P.E. Garrett et al., PRC57 ('98) R2085

K. Vetter, A.O. Macchiavelli et al., PRC58 ('98) R2631

V. Yu. Pnomarev and P. von Neumann-Cosel, PRL82 ('99) 501

B.A. Brown, PRL85 ('00) 5300

large fragmentations, especially 6^+ state

Application to $^{16}\text{O} + ^{208}\text{Pb}$ fusion reaction

cf. C.R. Morton et al., PRC60('99) 044608

potential energy surface of ^{208}Pb (RMF with PC-F1)

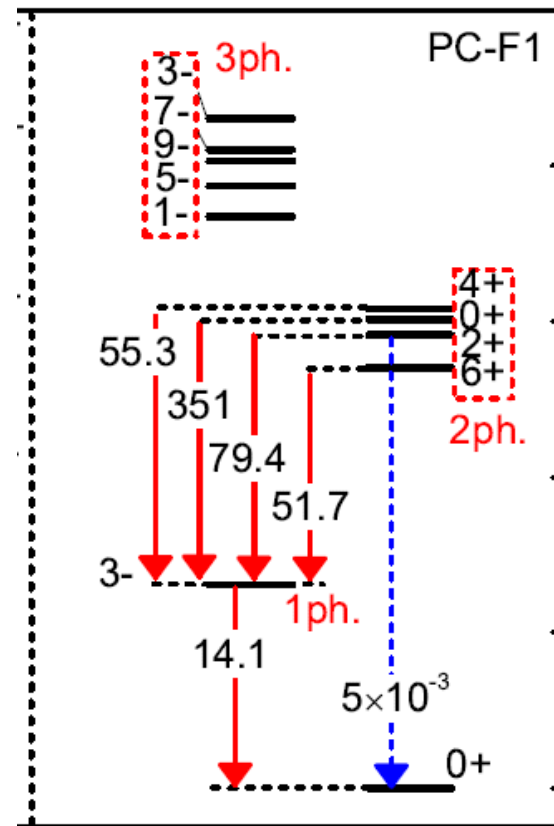

Expt. data

(a) Exp.

$\beta_2=0$, fluctuation in β_3

(c) GCM (β_3)

➤ $E_{2ph} \sim E_{1ph}$

➤ large anharmonicity in $B(E3)$;

cf. H.O.: $B(E3: I_{2ph} \rightarrow 3_1^-) = 2 B(E3: 3_1^- \rightarrow g.s.)$

➤ underestimate $B(E3)$ (and $B(E2)$)

expt. data

fluctuation both
in β_3 and β_2

fluctuation in β_3
frozen at $\beta_2=0$

(a) Exp.

(b) GCM (β_2 - β_3)

(c) GCM (β_3)

2_1^+ state: strong coupling both to g.s. and 3_1^-

$$\longrightarrow |2_1^+\rangle = \alpha|2^+\rangle_{\text{HO}} + \beta|[3^- \otimes 3^-]^{(I=2)}\rangle_{\text{HO}} + \dots$$

J.M. Yao and K.H.,
PRC94 ('16) 11303(R)

Summary

Heavy-ion subbarrier fusion reactions

- ✓ strong interplay between reaction and structure
cf. fusion barrier distributions

➤ C.C. calculations combined with beyond-MF method

- ✓ anharmonicity
- ✓ octupole vibrations: $^{16}\text{O} + ^{208}\text{Pb}$

more flexibility:

- application to transitional nuclei
- a good guidance to a Q-moment of excited states in spherical nuclei

C.C. with shell model?
