

# Observation of SNe & GW event at Yunnan Observatories

Ju-Jia Zhang

Yunnan Observatories, Chinese Academy of Sciences

1. Overview of Yunnan Observatories
2. Li-Jiang transient programs (LiONS and Mephisto)
3. Blue transient survey at the New site (Daocheng-Aden)

# 1. Overview of Yunnan Observatories

# Li-Jiang Observatory

† Position:

100°2'(E), 26°42'(N)

Dec.: +90~-44°

(e.g., SN 2016adj at -43°)

† Altitude: 3200m

† Obs. time: 2200h/yr

† Seeing: ~1.0"

† Sky brightness:

V = 21.54 mag

B = 22.34 mag

† Extinction:

V = 0.14 mag

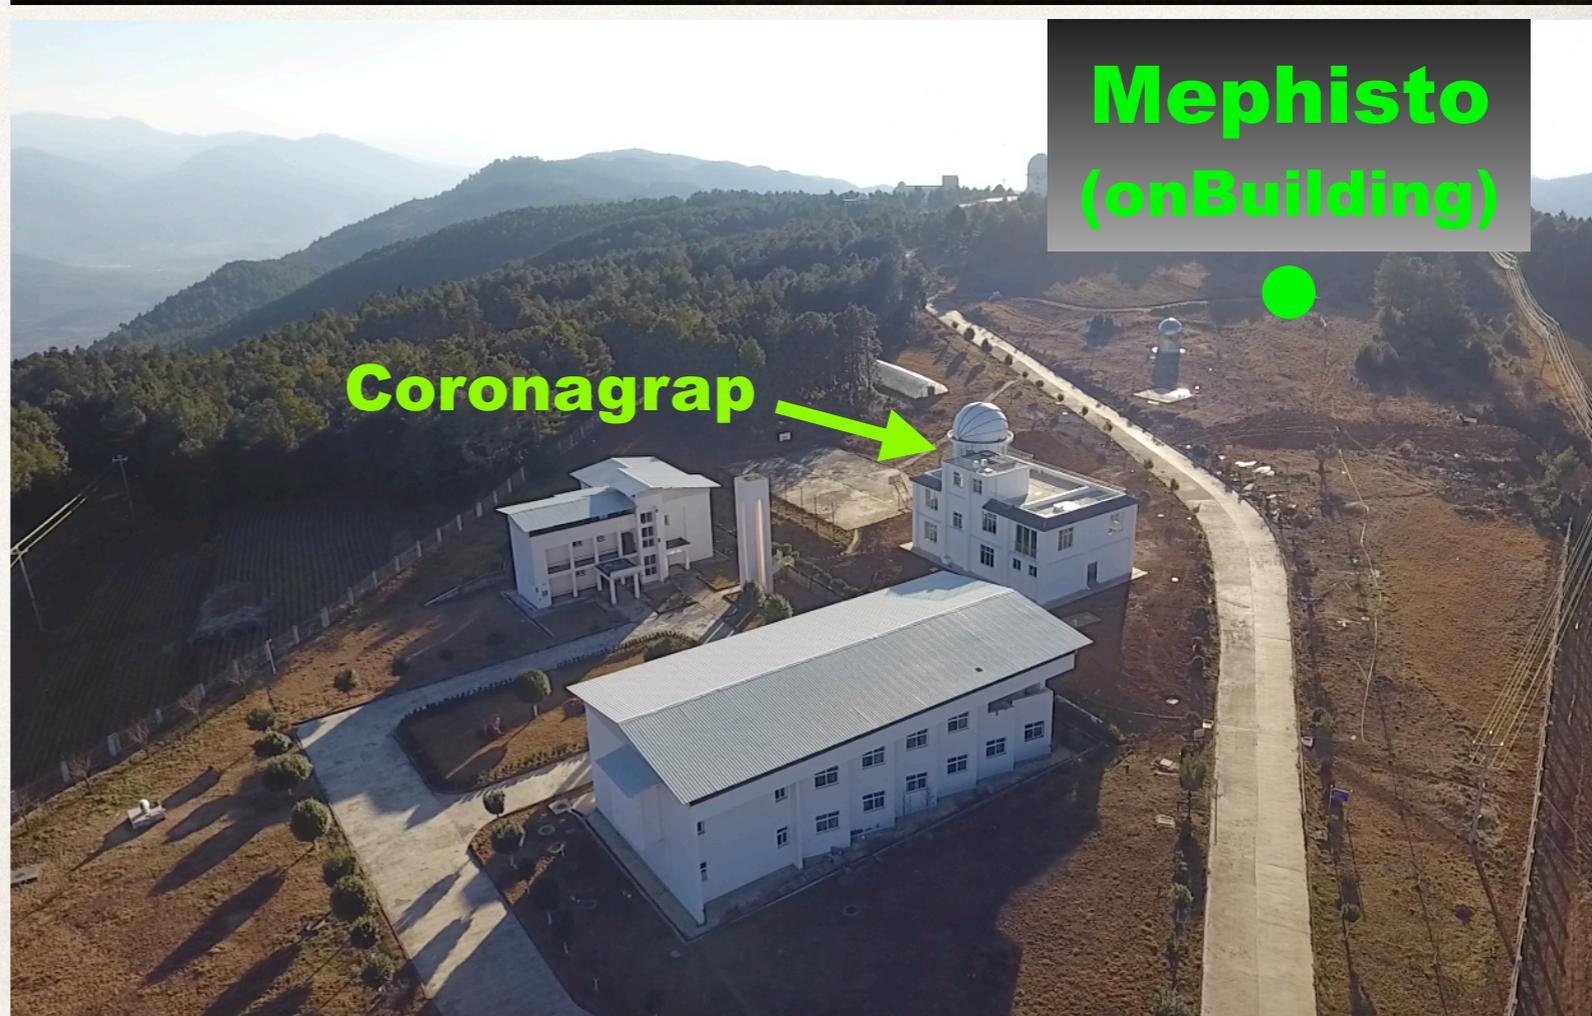

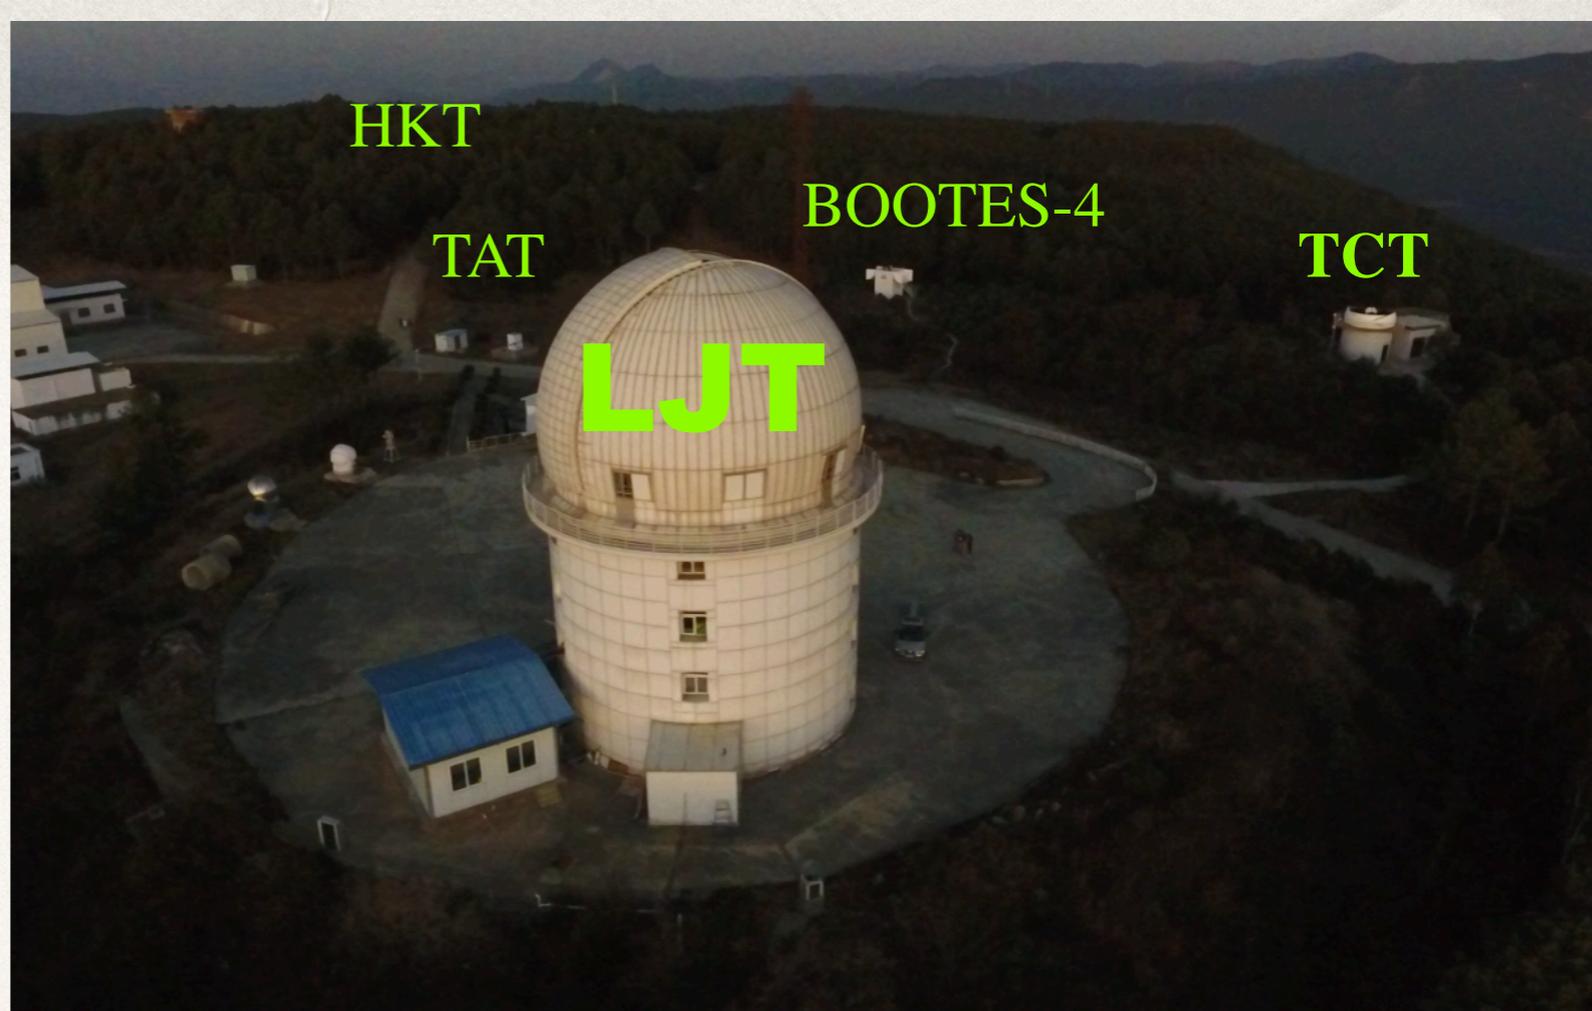

B = 0.27 mag

U = 0.50 mag

† Vapor:

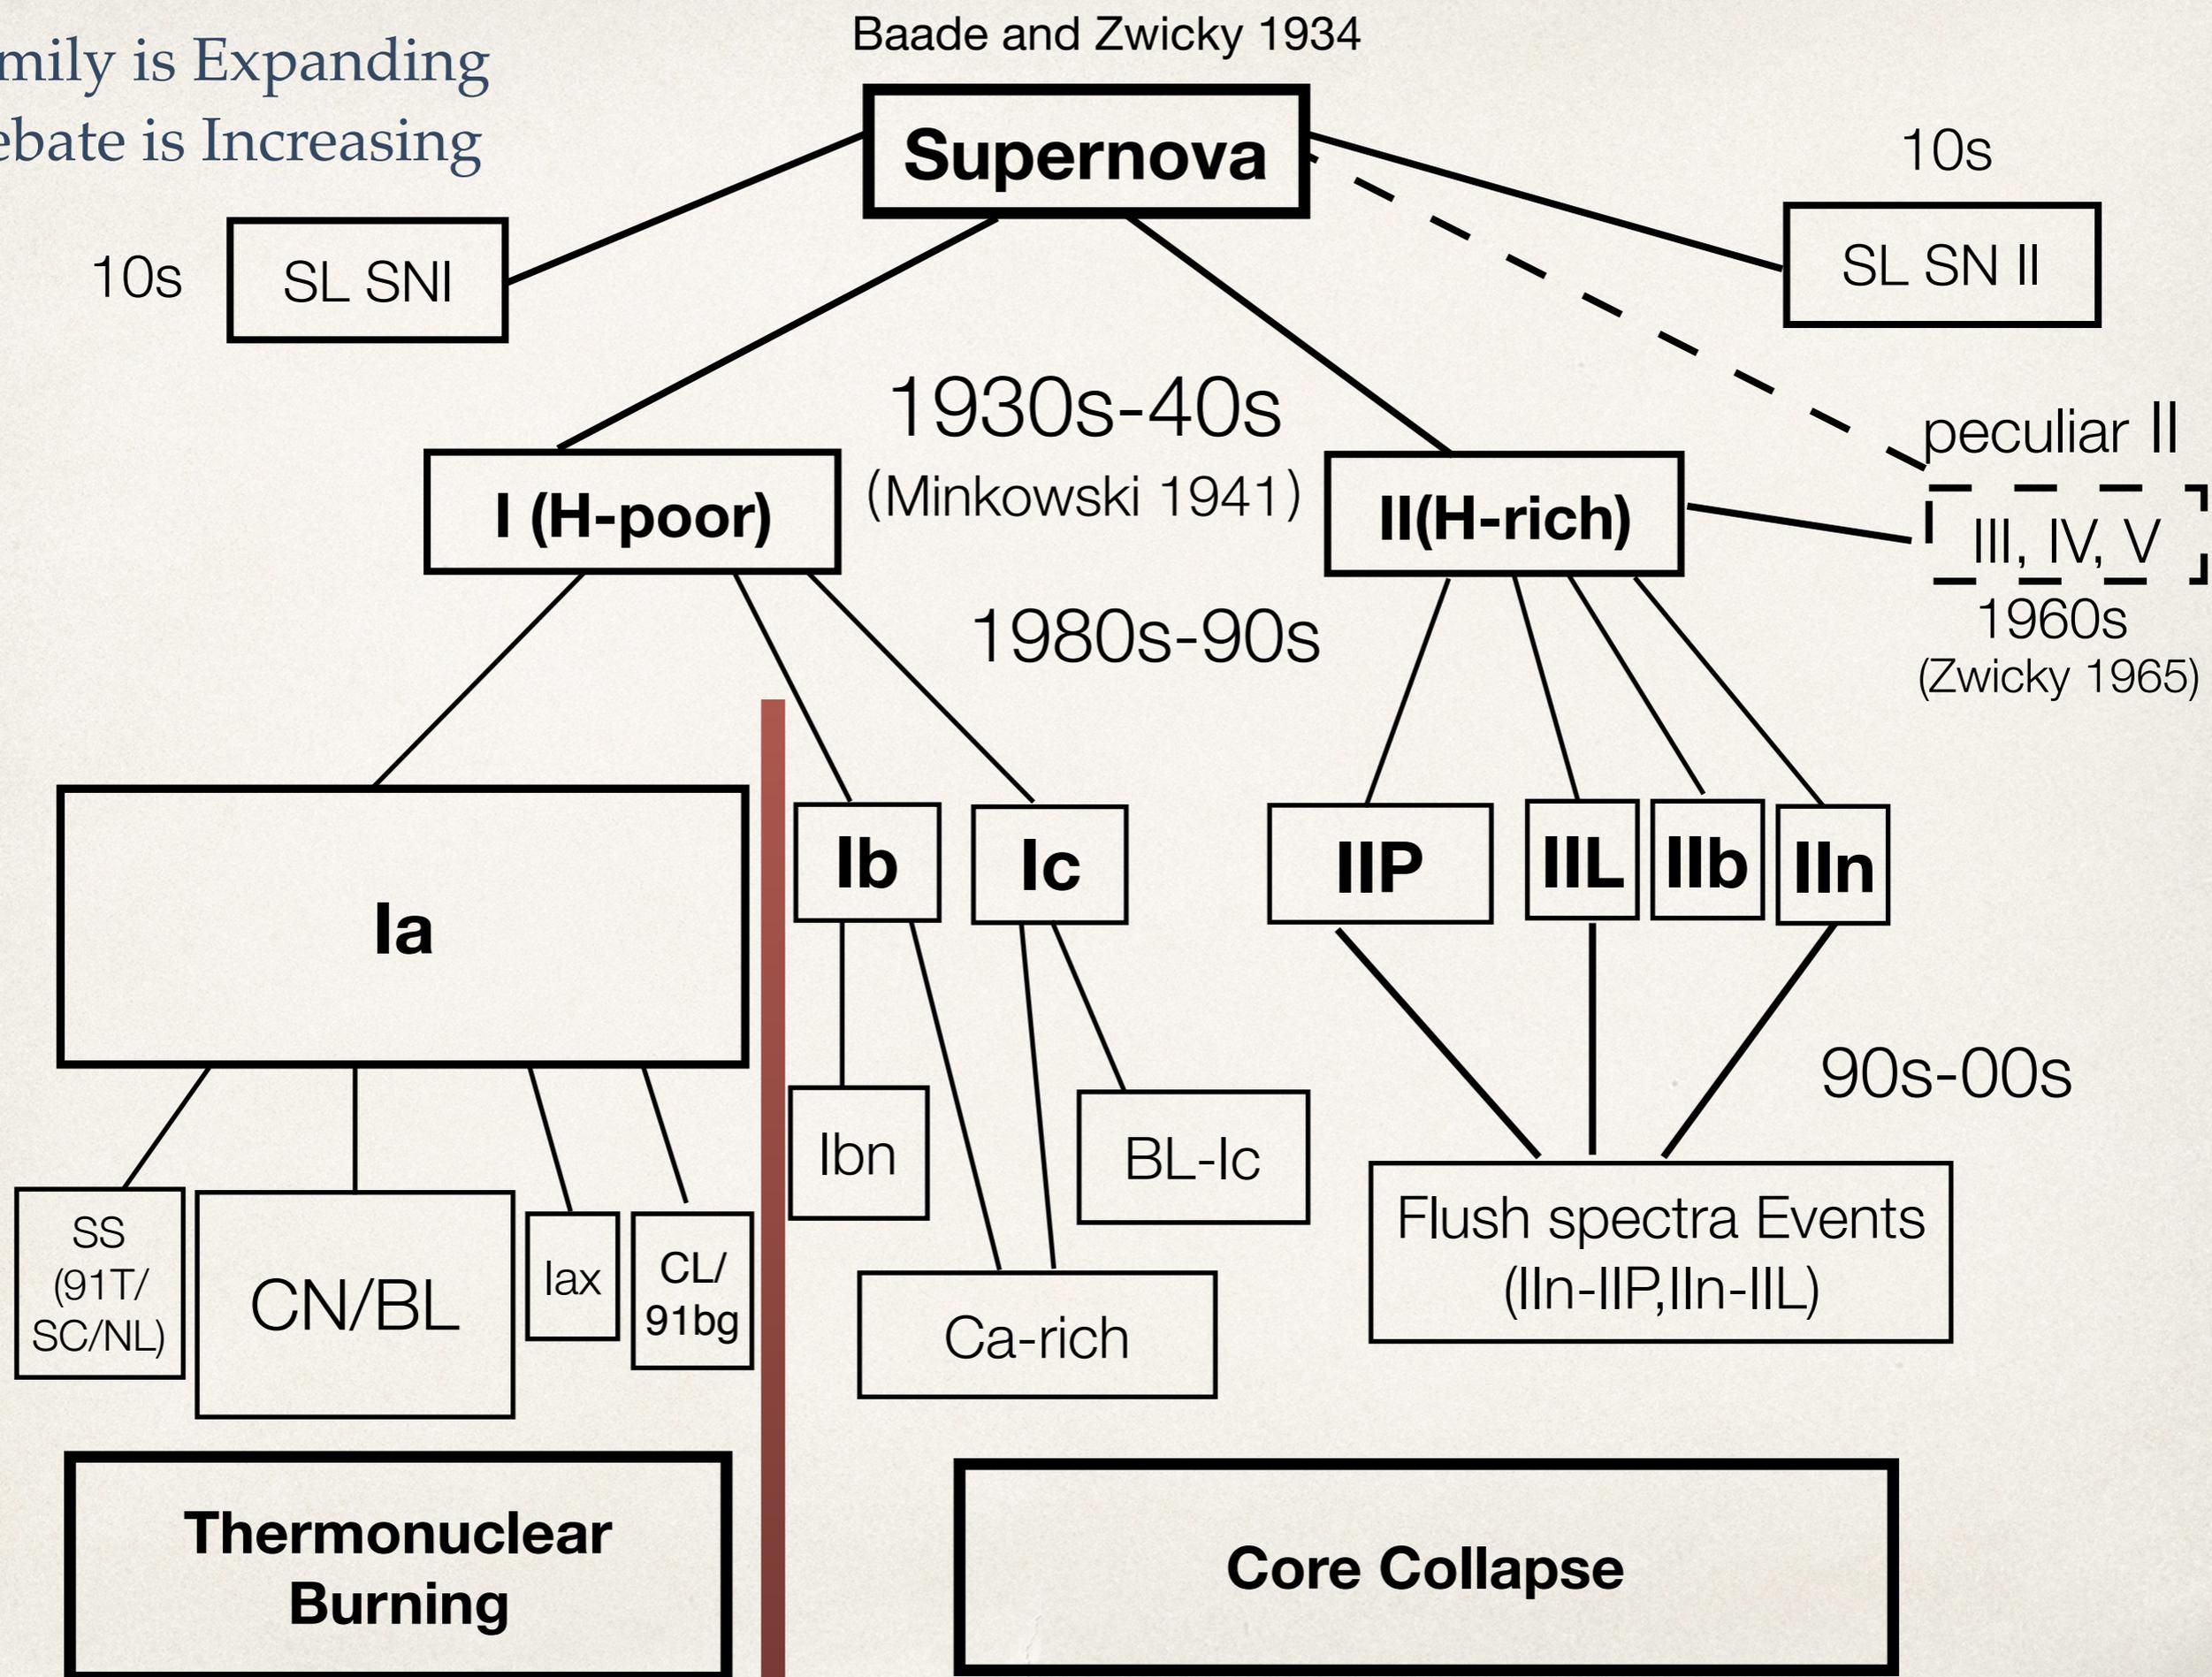

4.3 mm (Oct.~April)

13.0 mm (May~Sep.)

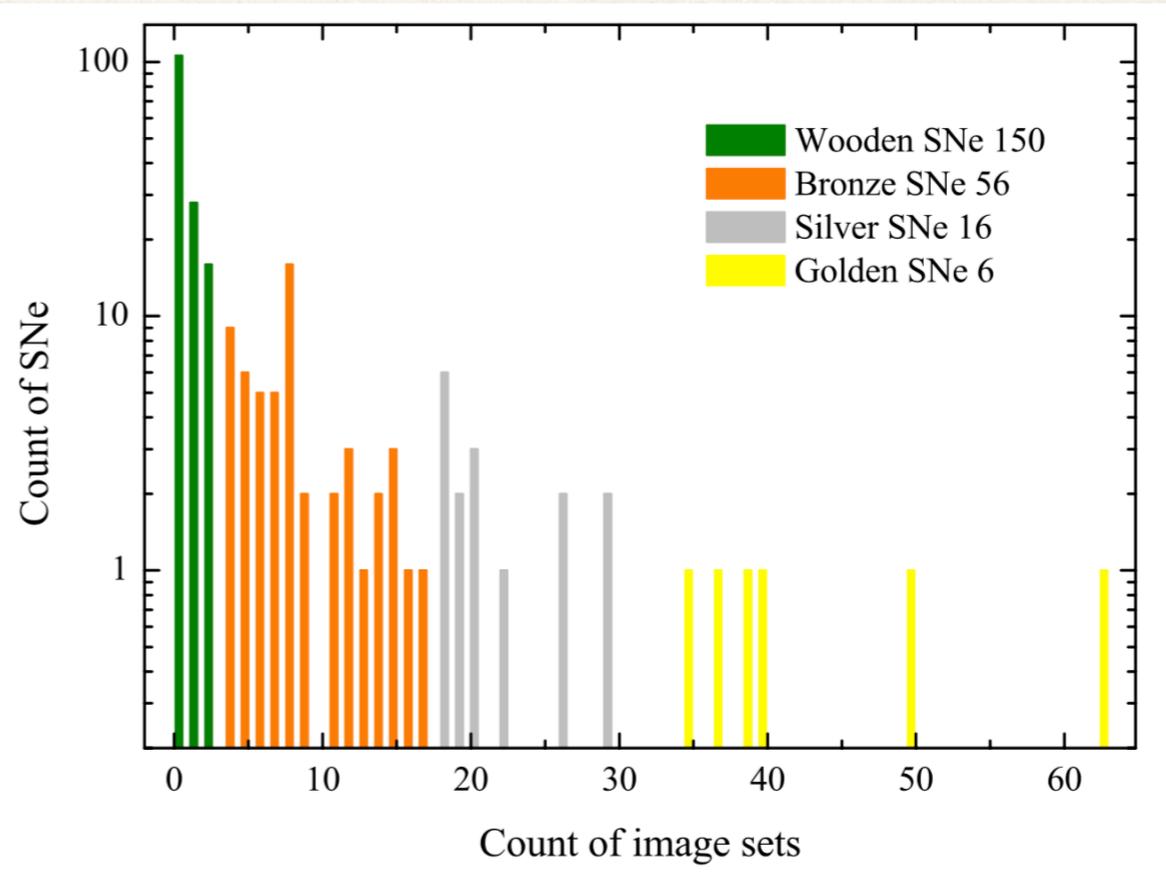

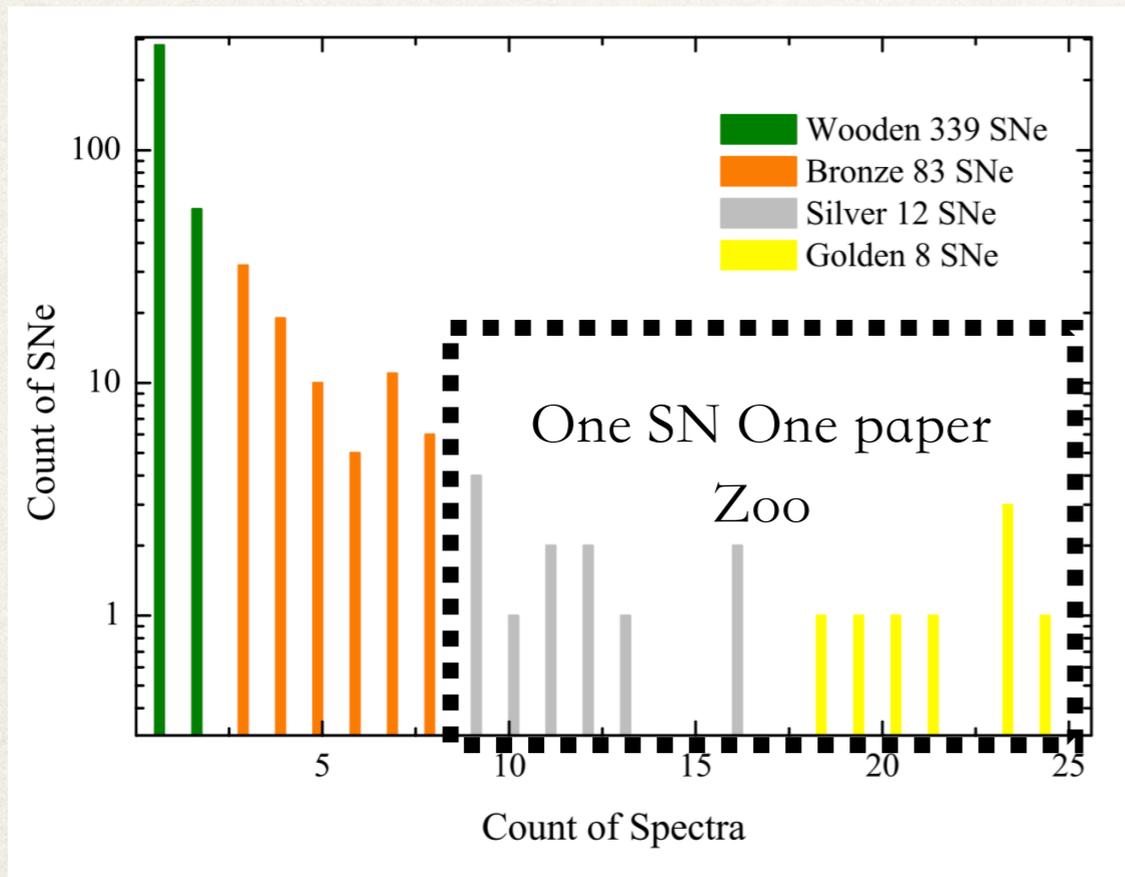

# 2. Li-Jiang transient programs (LiONS and Mephisto)

Family is Expanding  
Debate is Increasing

**Li-jiang One hour per Night Supernova program (LiONS) with LJT**  
classified > 200 SNe (70% before the peak)

**Ia:** SN 2011hr (Zhang J.J.,+2016), SN 2012fr(Zhang J.J., +2014a), iPTF 14bdn (Smitka+2015), SN 2013dy (Zhai+2016), SN 2011fe(Zhang K.C.+2016), SN 2014J (Zhang K.C. + 2018), SN 2018oh(Li W.X., + 2018), SN 2014ek (Li L.Y.,+2018), SN 2013gy (Holmbo+ 2018), SN 2013gs (Zhang T.M., + 2019), SNe Statistics (Zhao + 2015, 2016).

**Ib/c:** SN 2014L(Zhang J.J., +2018.) , SN 2014av (Pastorello+2016), SN 2016coi (Prentice +2018), SN 2017ein (Xiang+2018).

**IIP:** SN 2013am (Zhang J.J., +2014b), SN 2013ej(Huang+2015), SN 2014cx(Huang+2016), iPTF 14hls (Arcavi+ 2017), SN 2016X (Huang+2018).

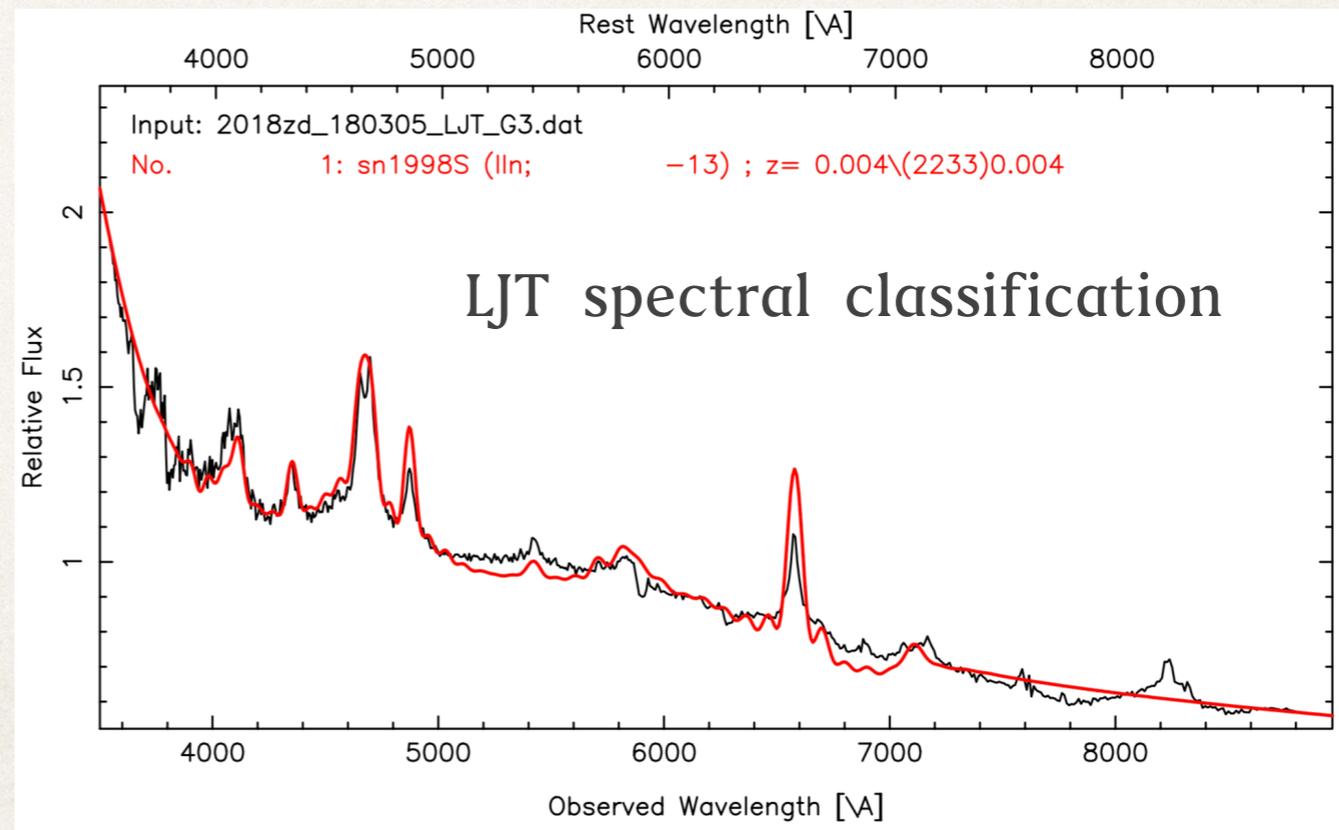

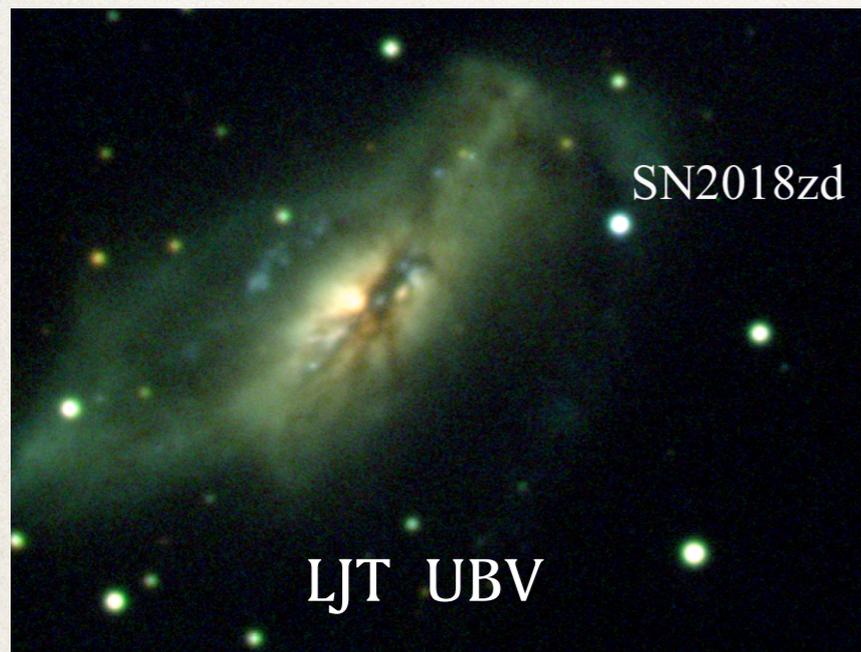

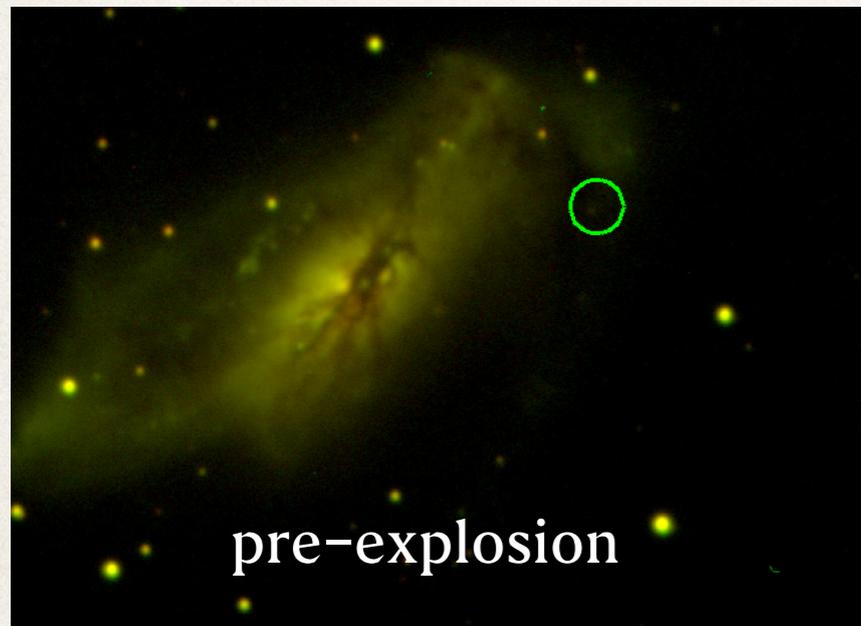

A case of LiONS project: SN 2018zd (in prep.)

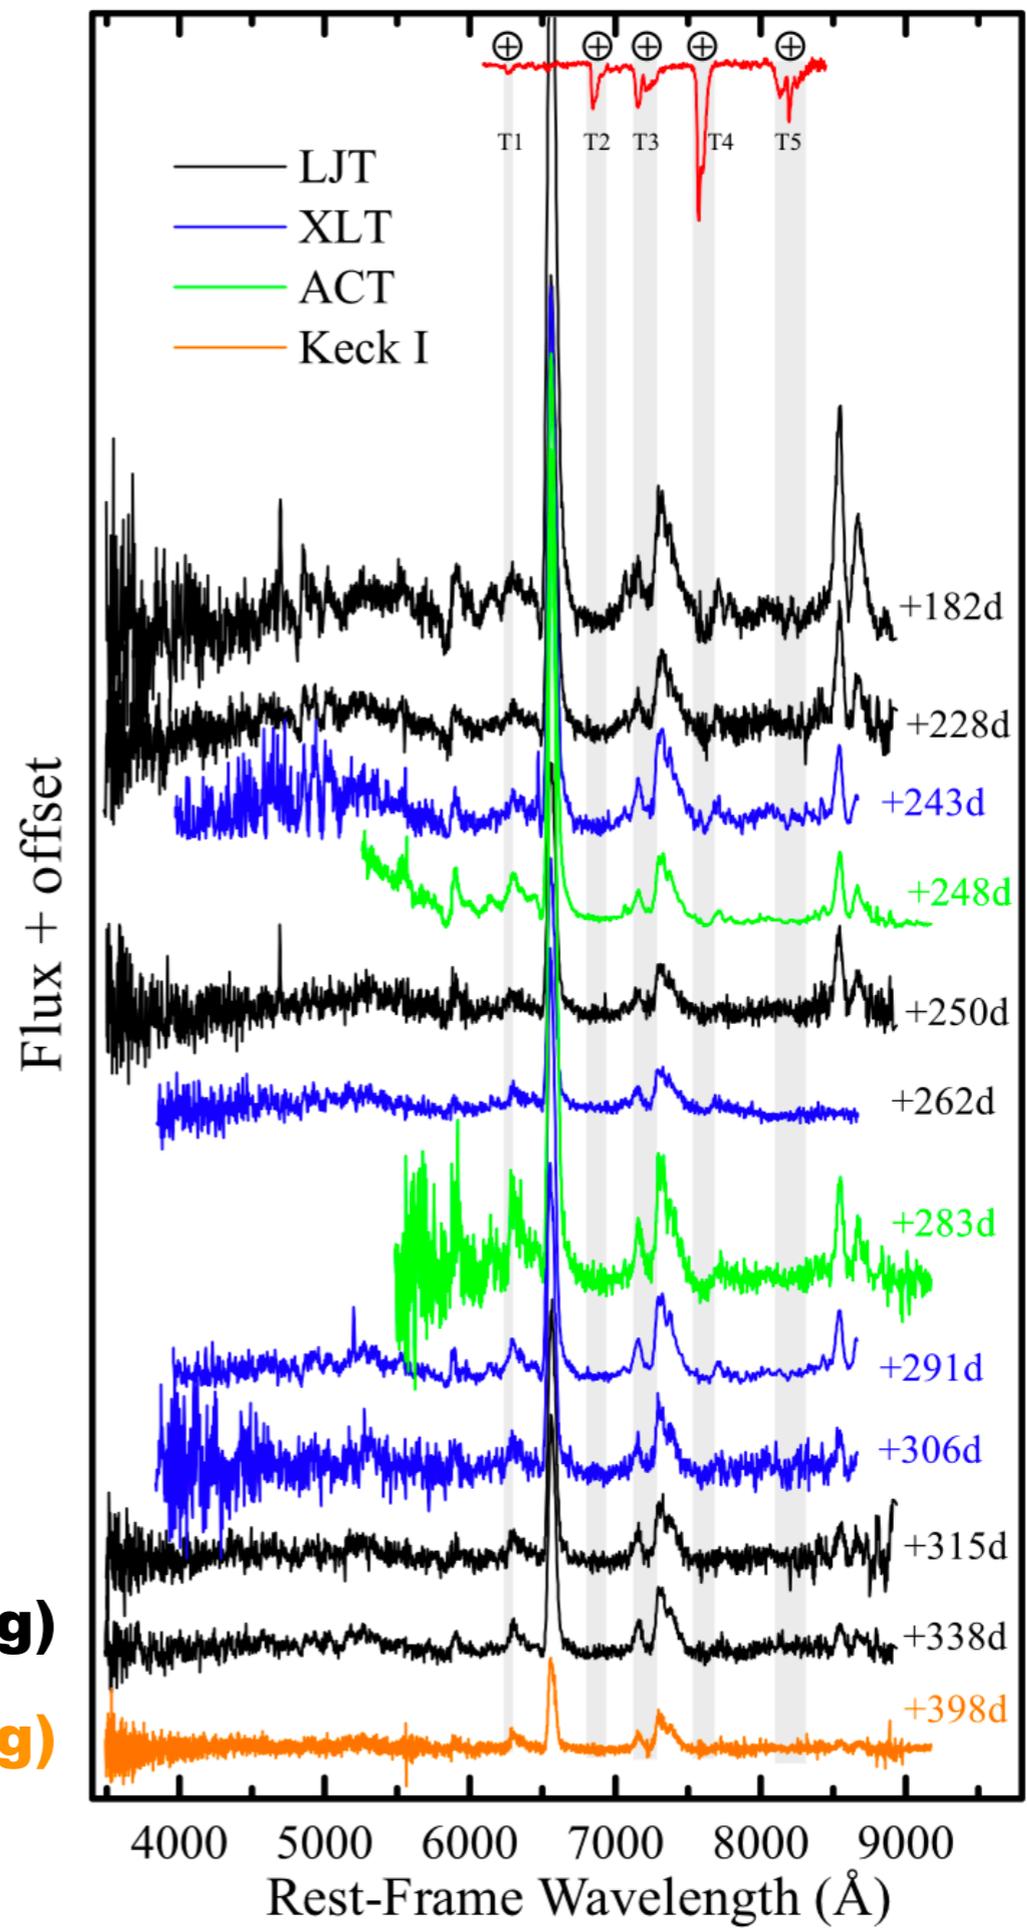

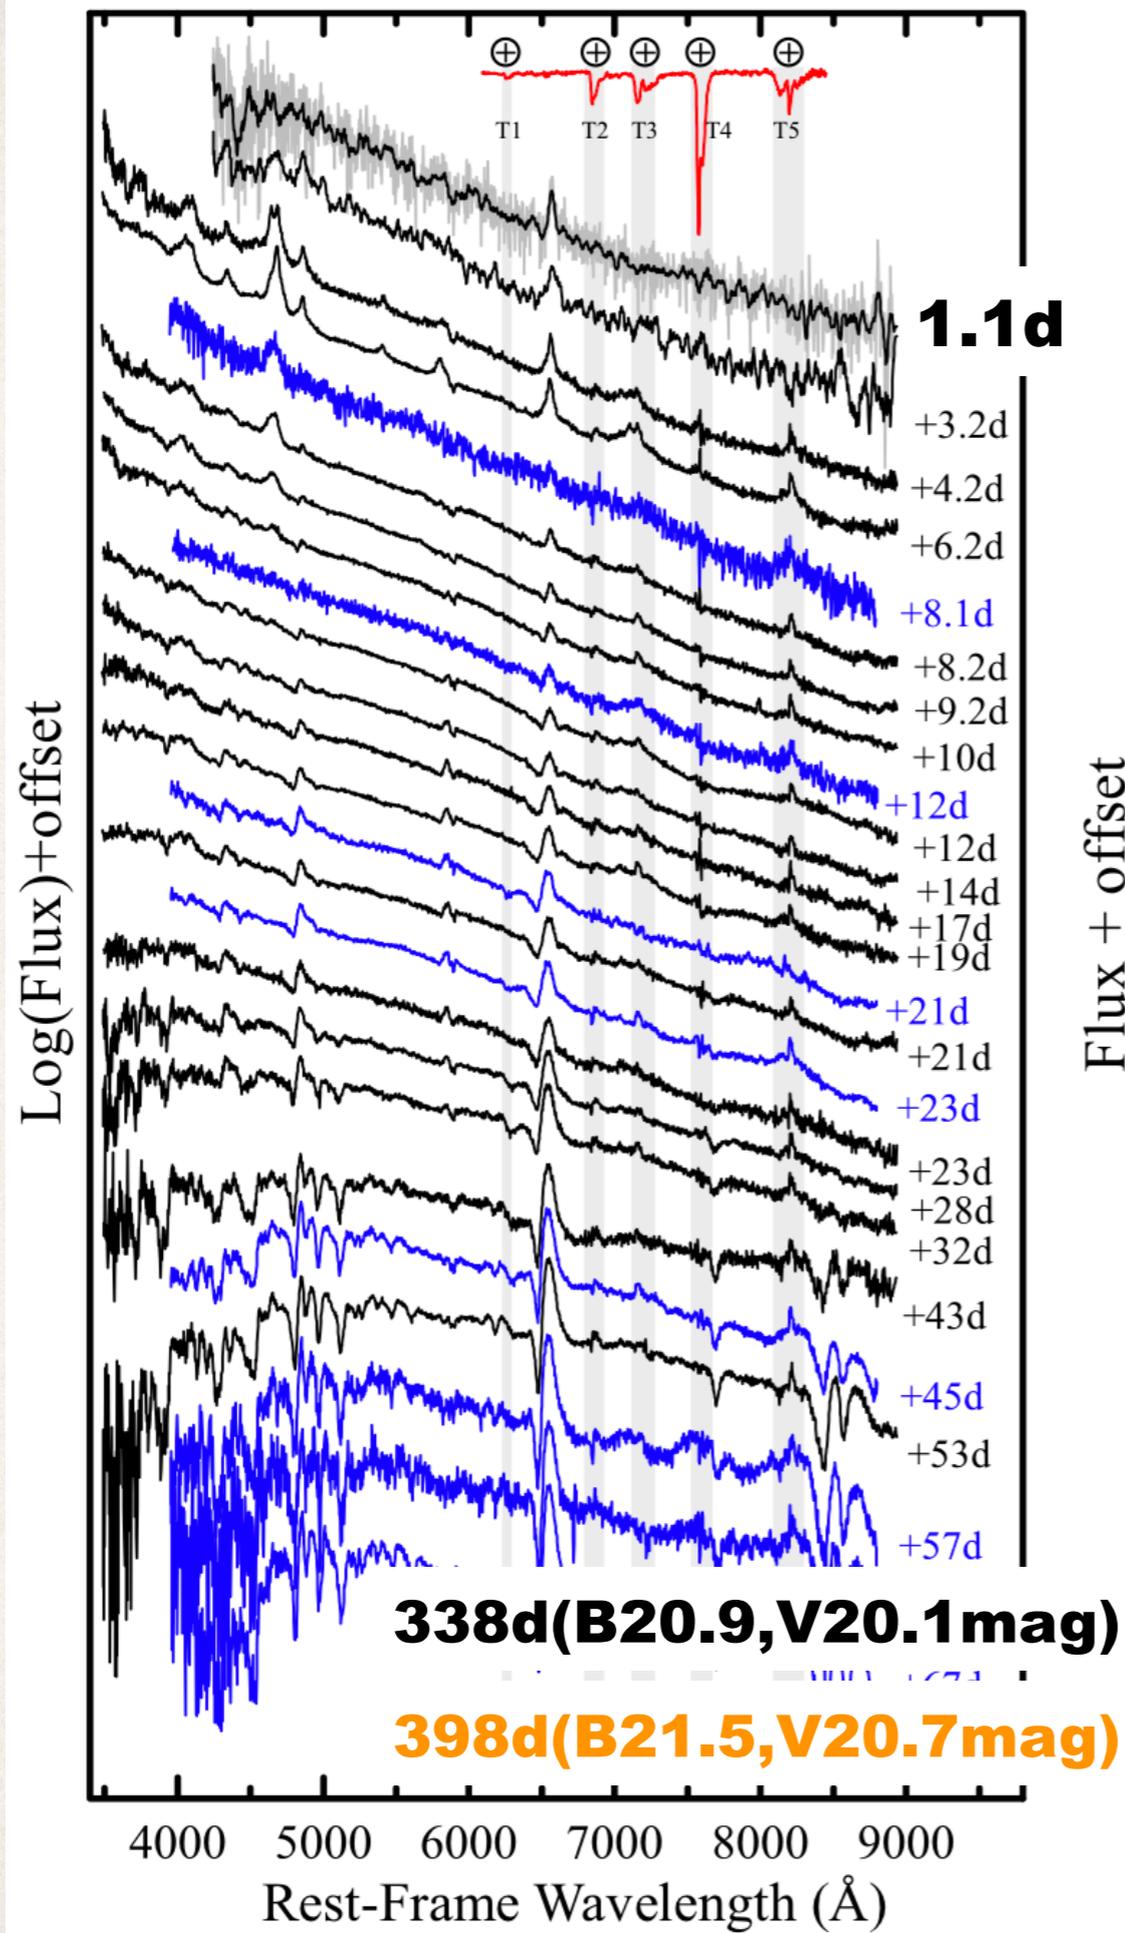

SN II with Short-lived 'flash emission'

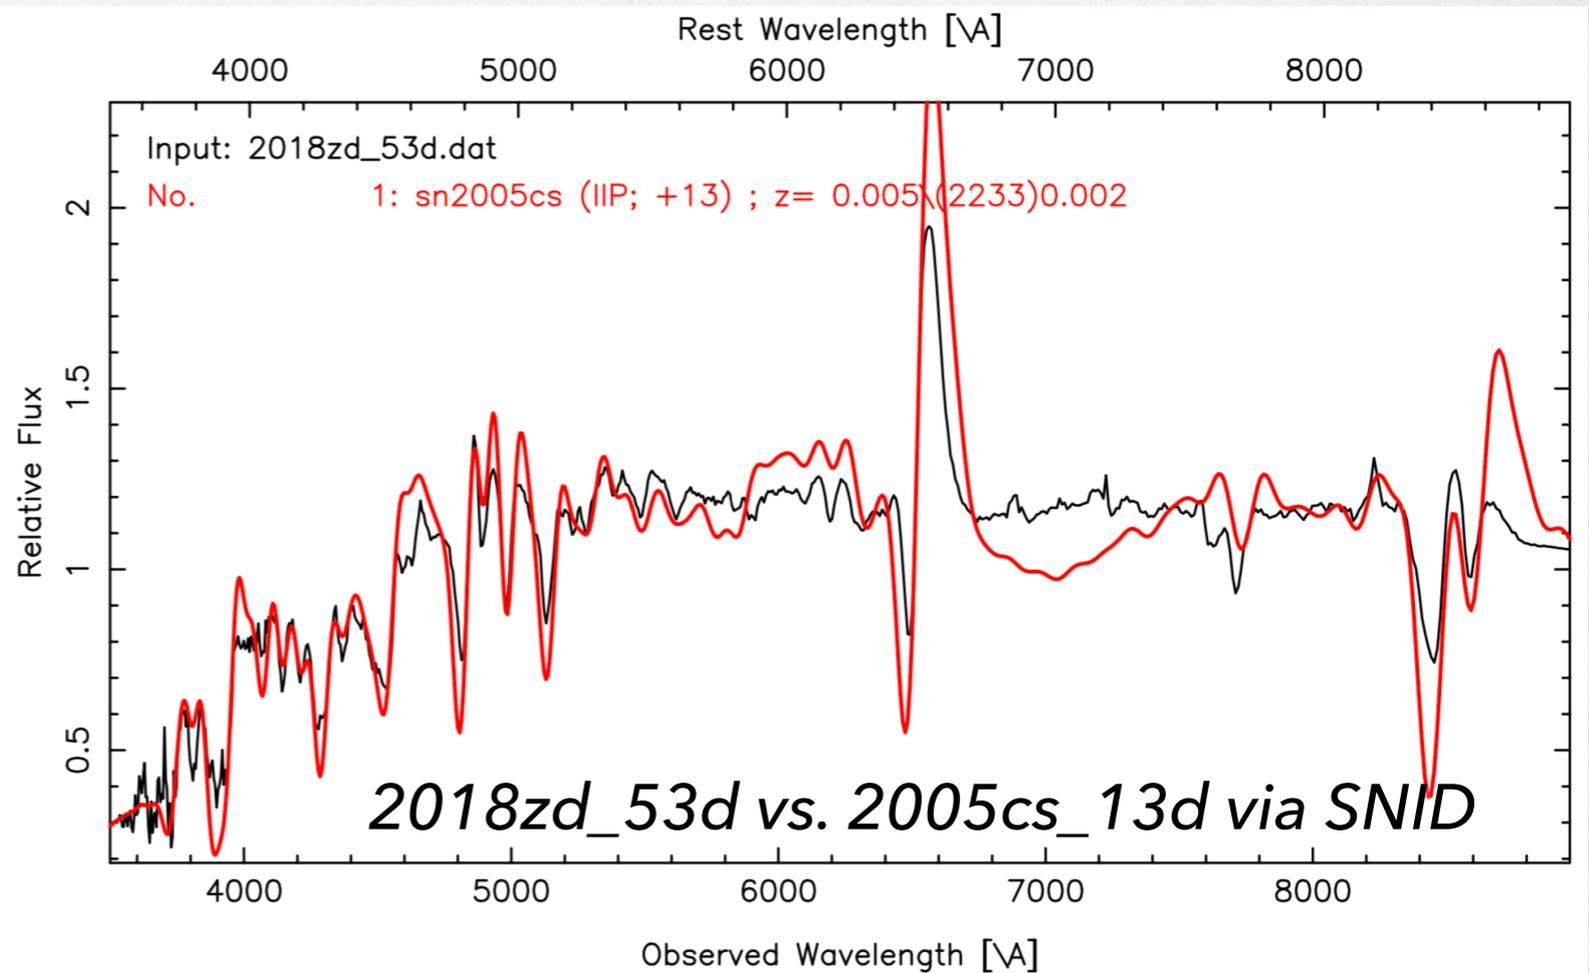

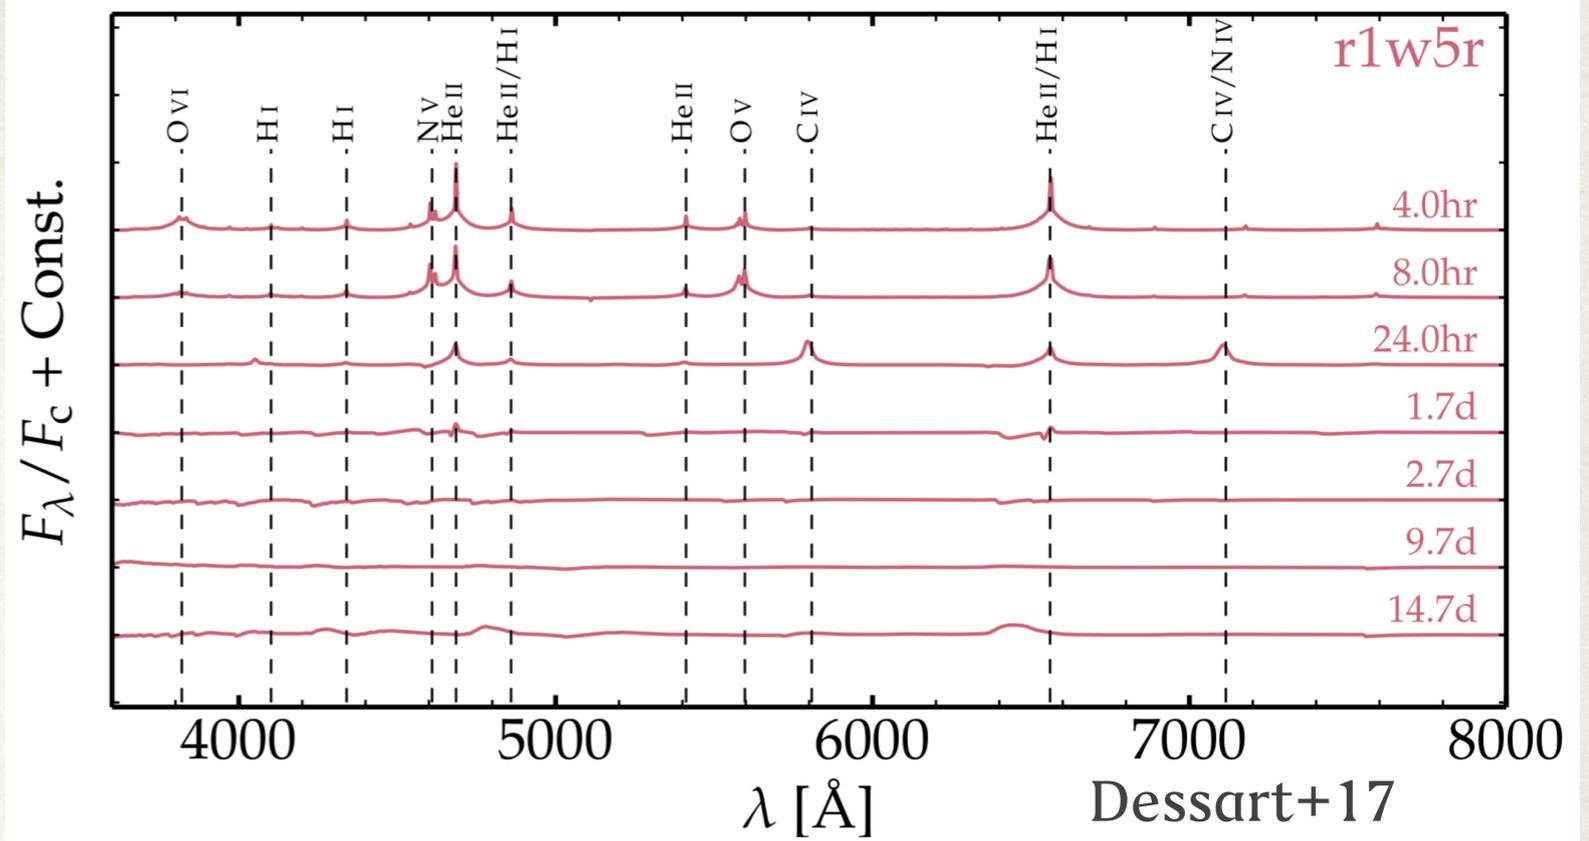

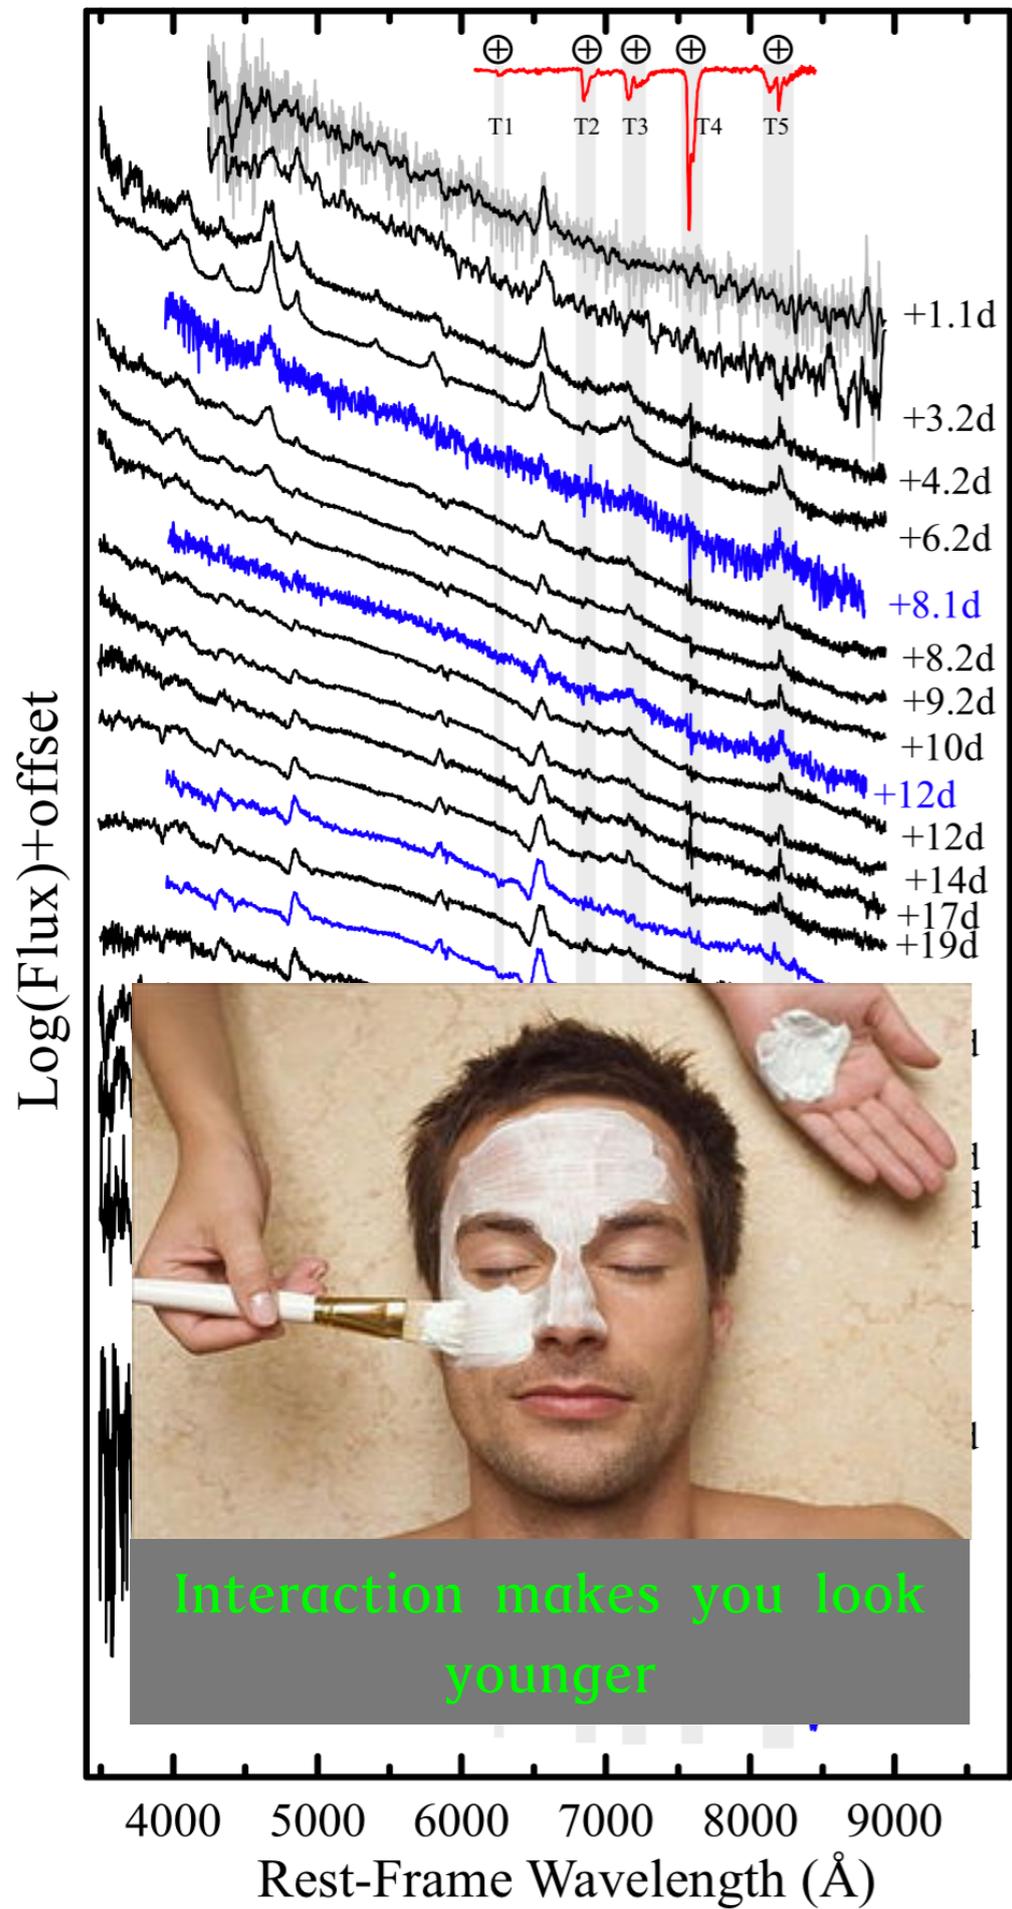

NGC 2146 (18Mpc)

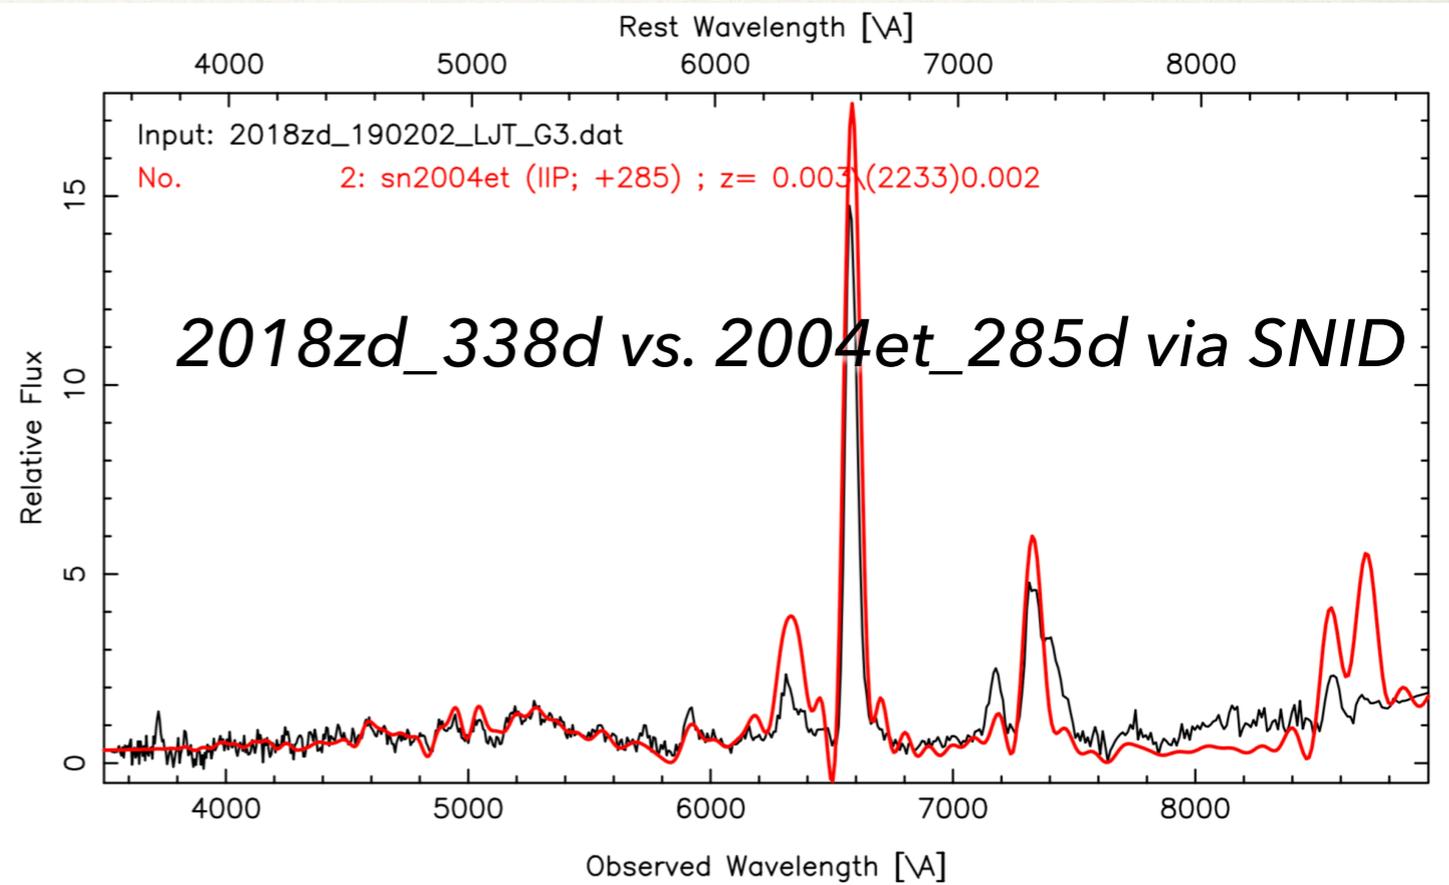

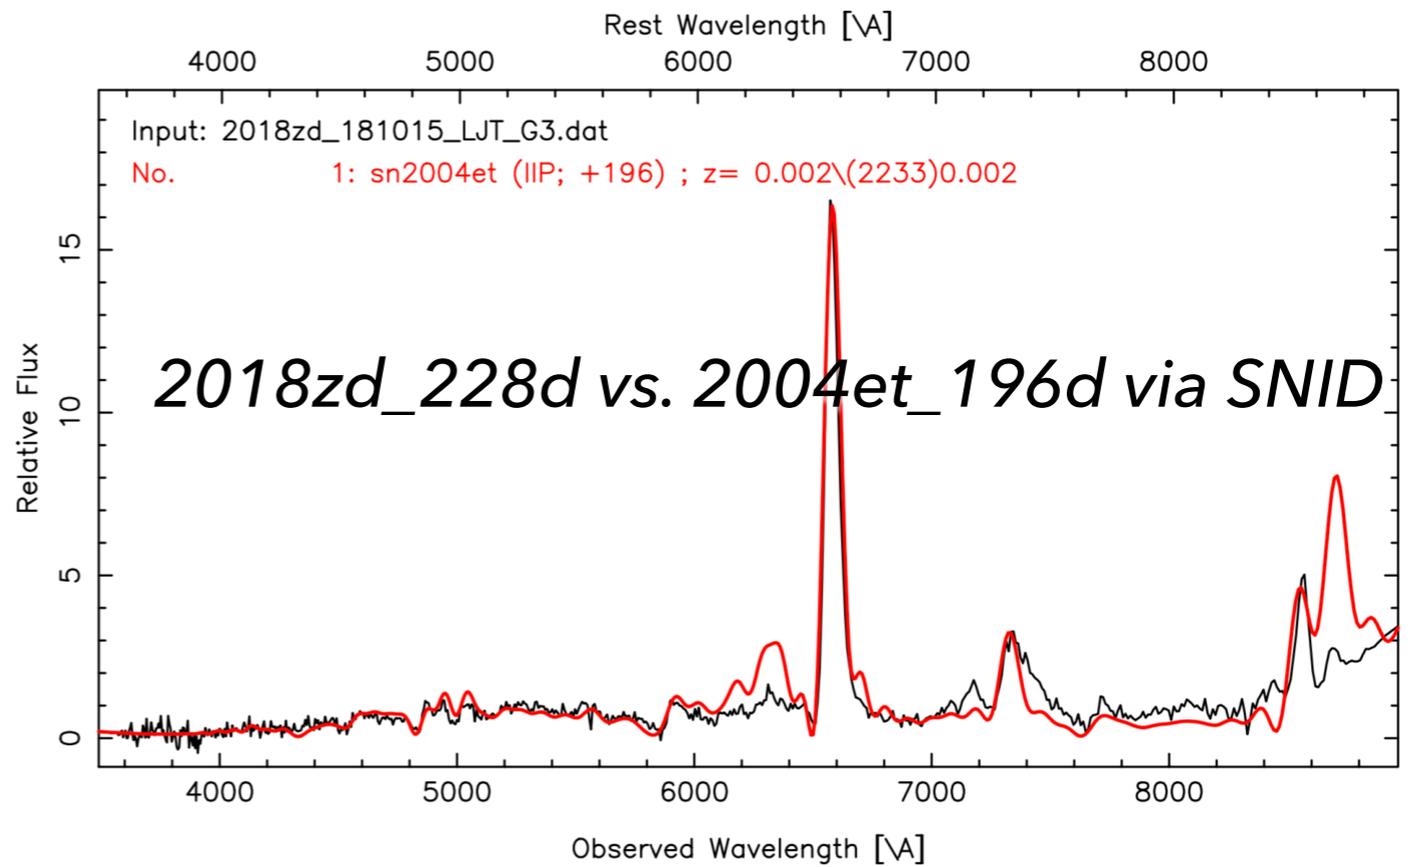

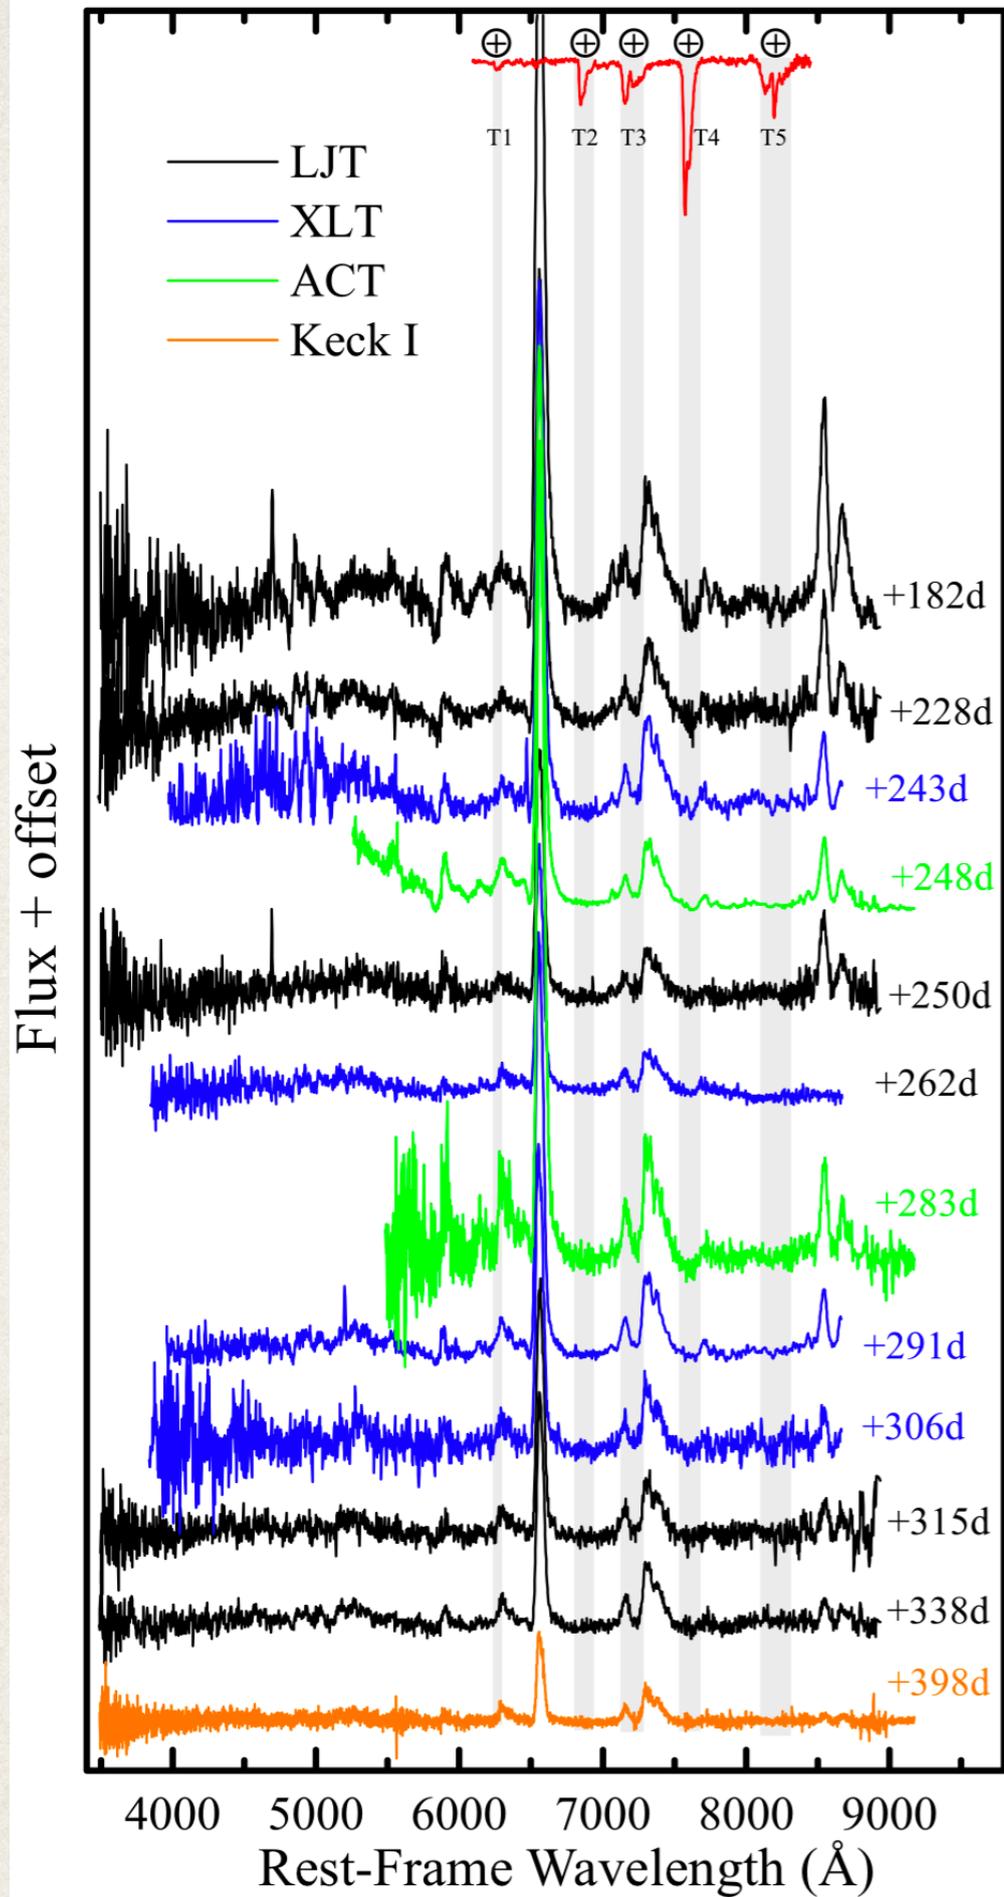

Discovered by Koichi Itagaki

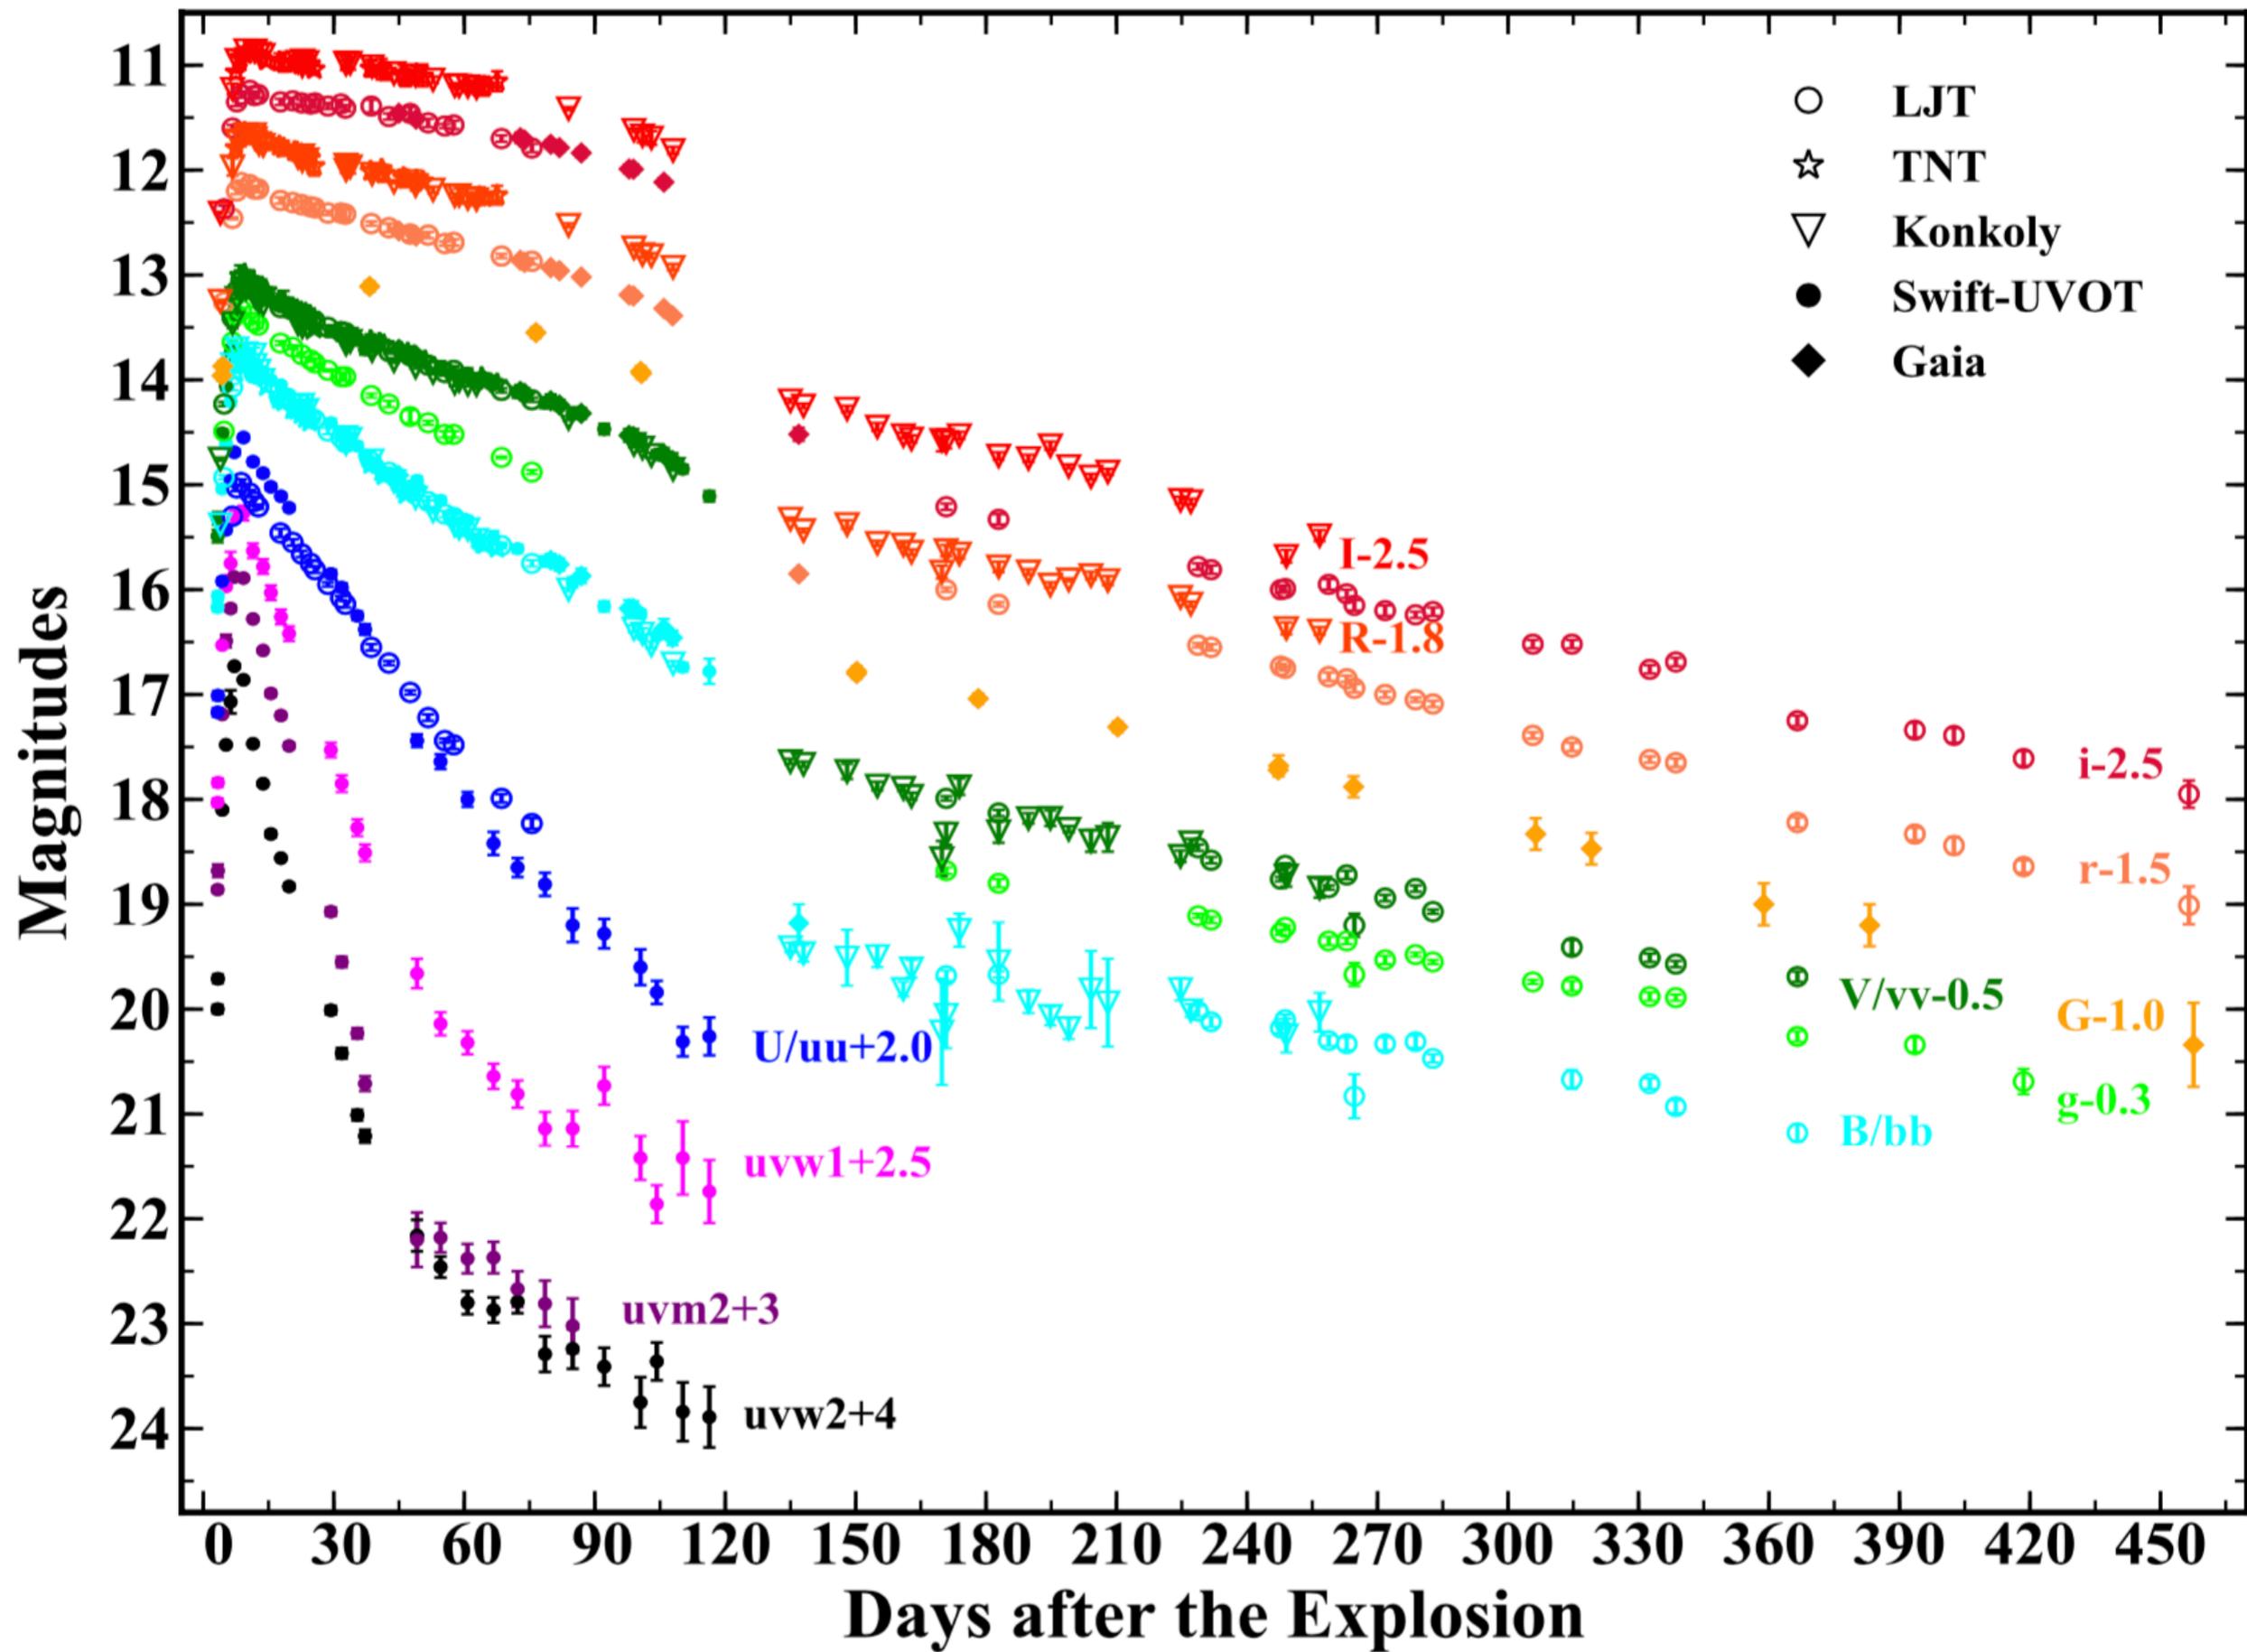

Spectral Classified by LJT (Zhang+18)

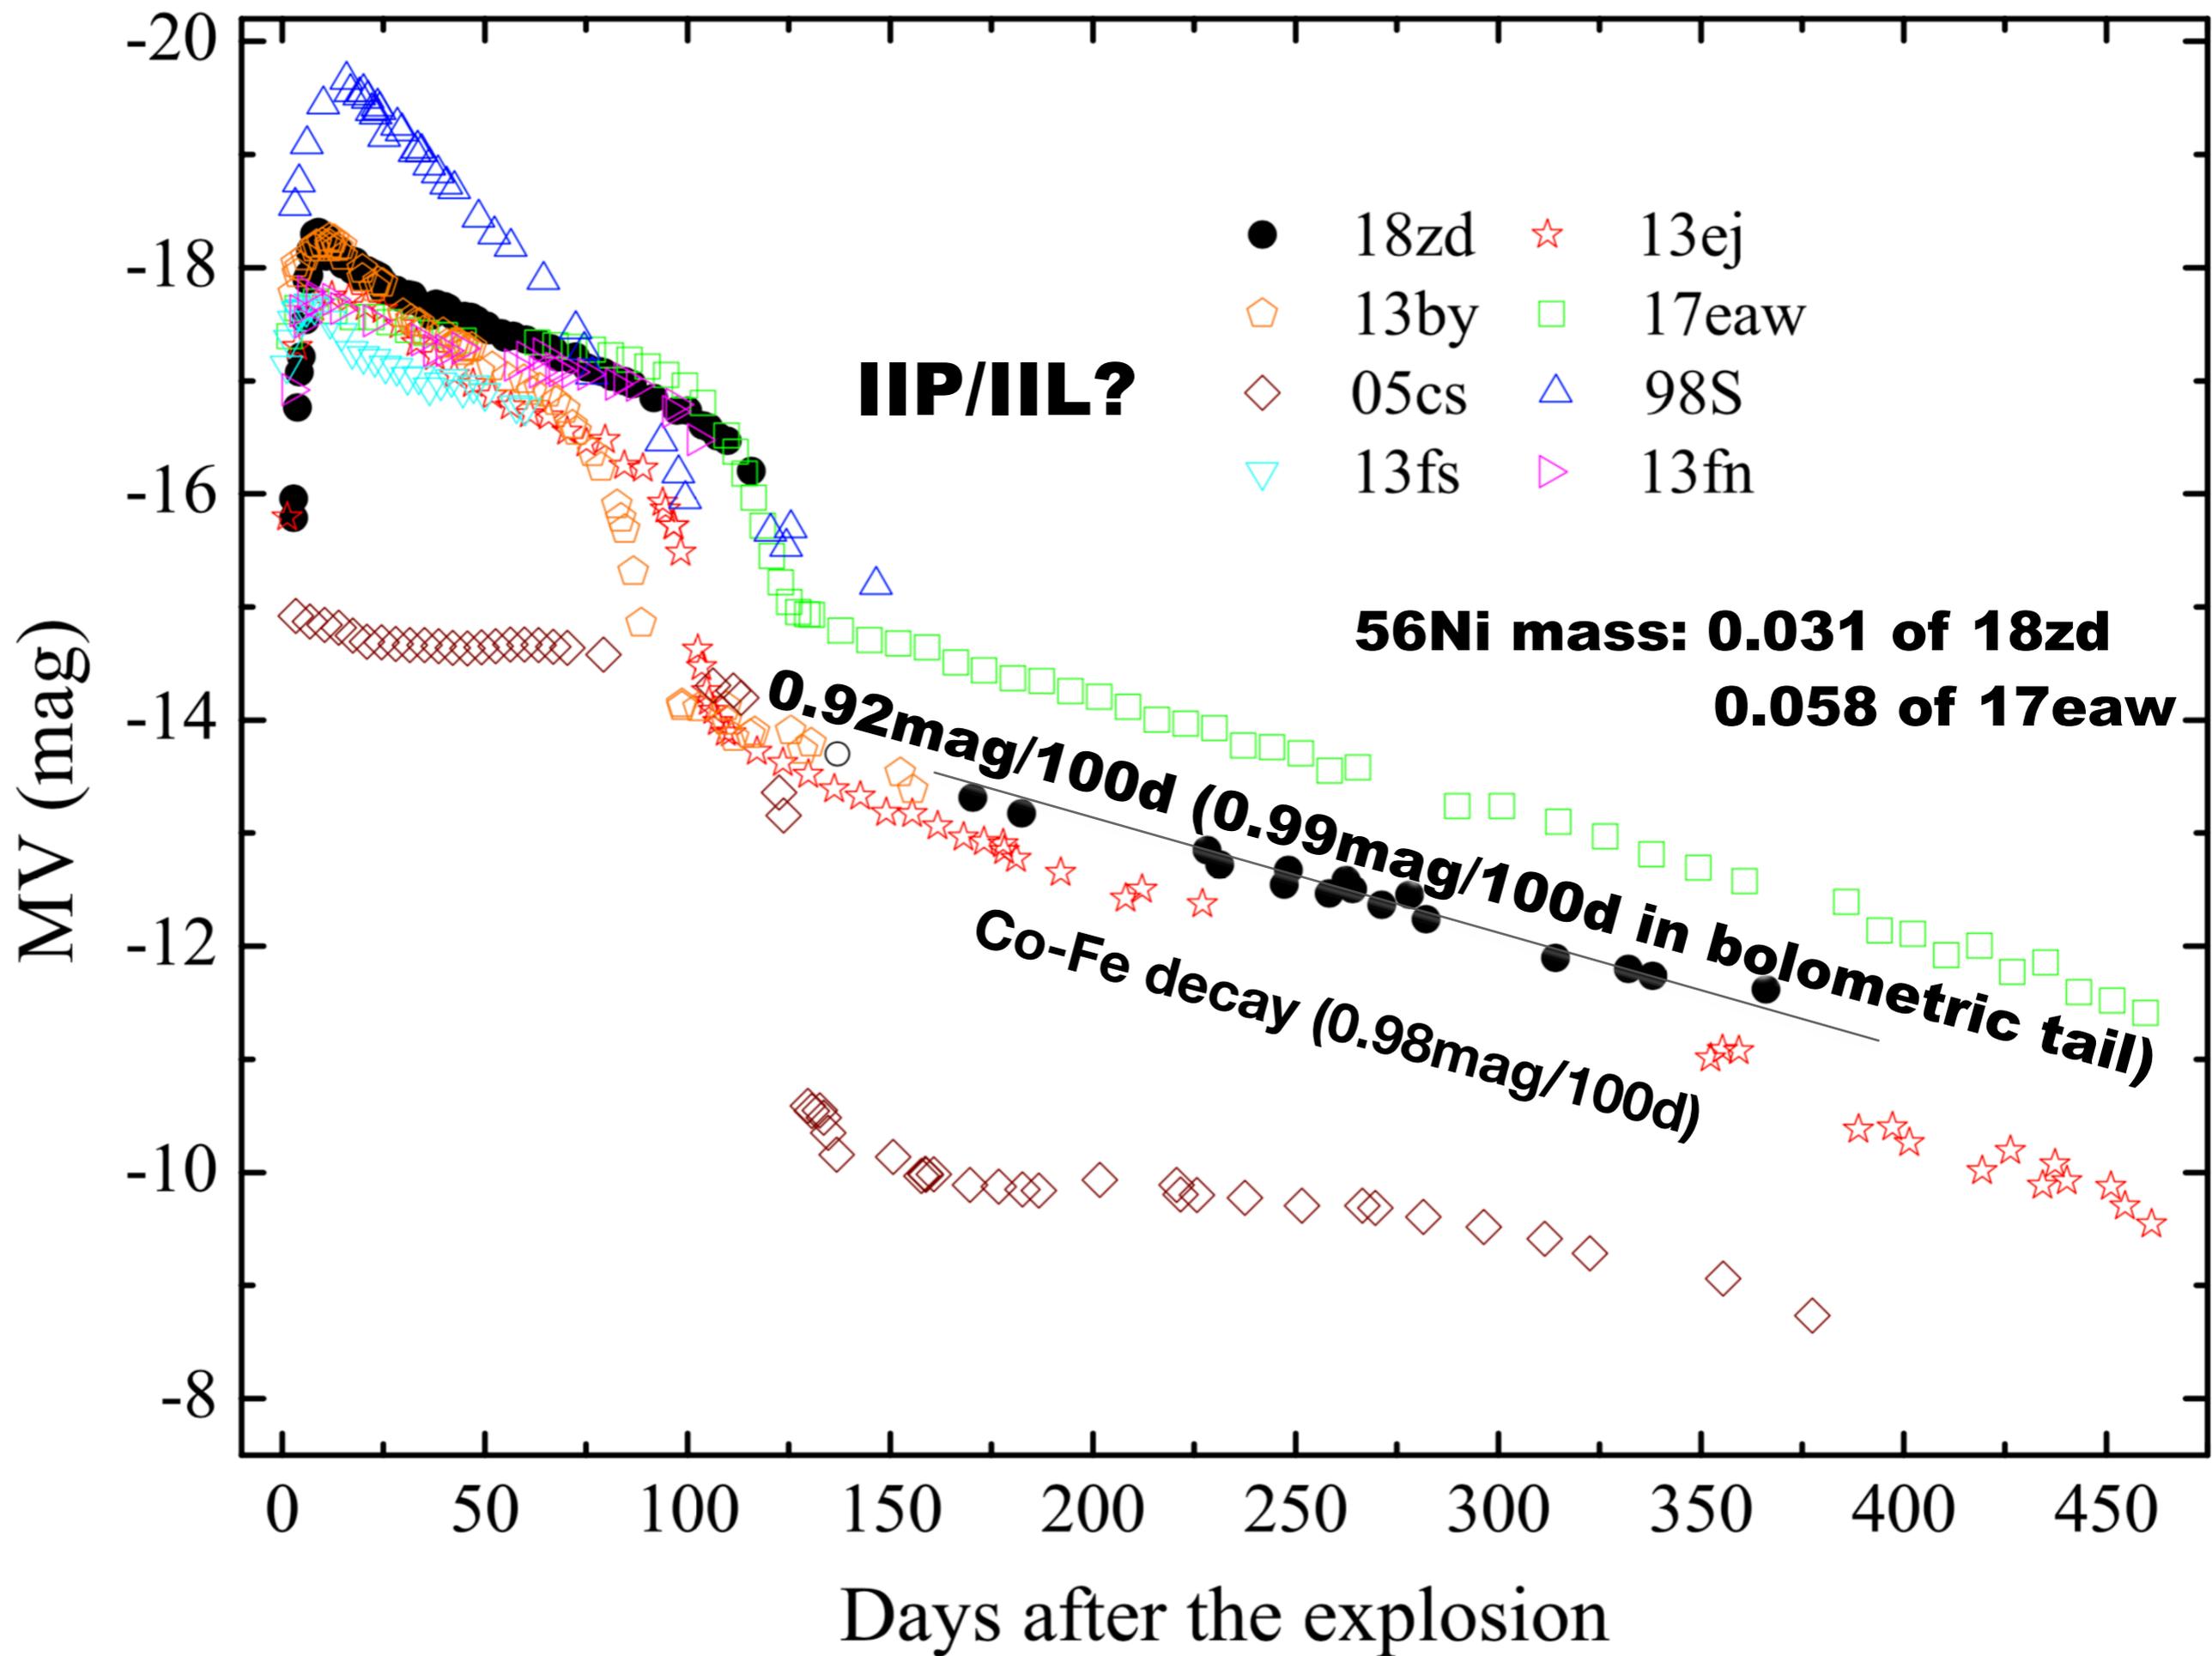

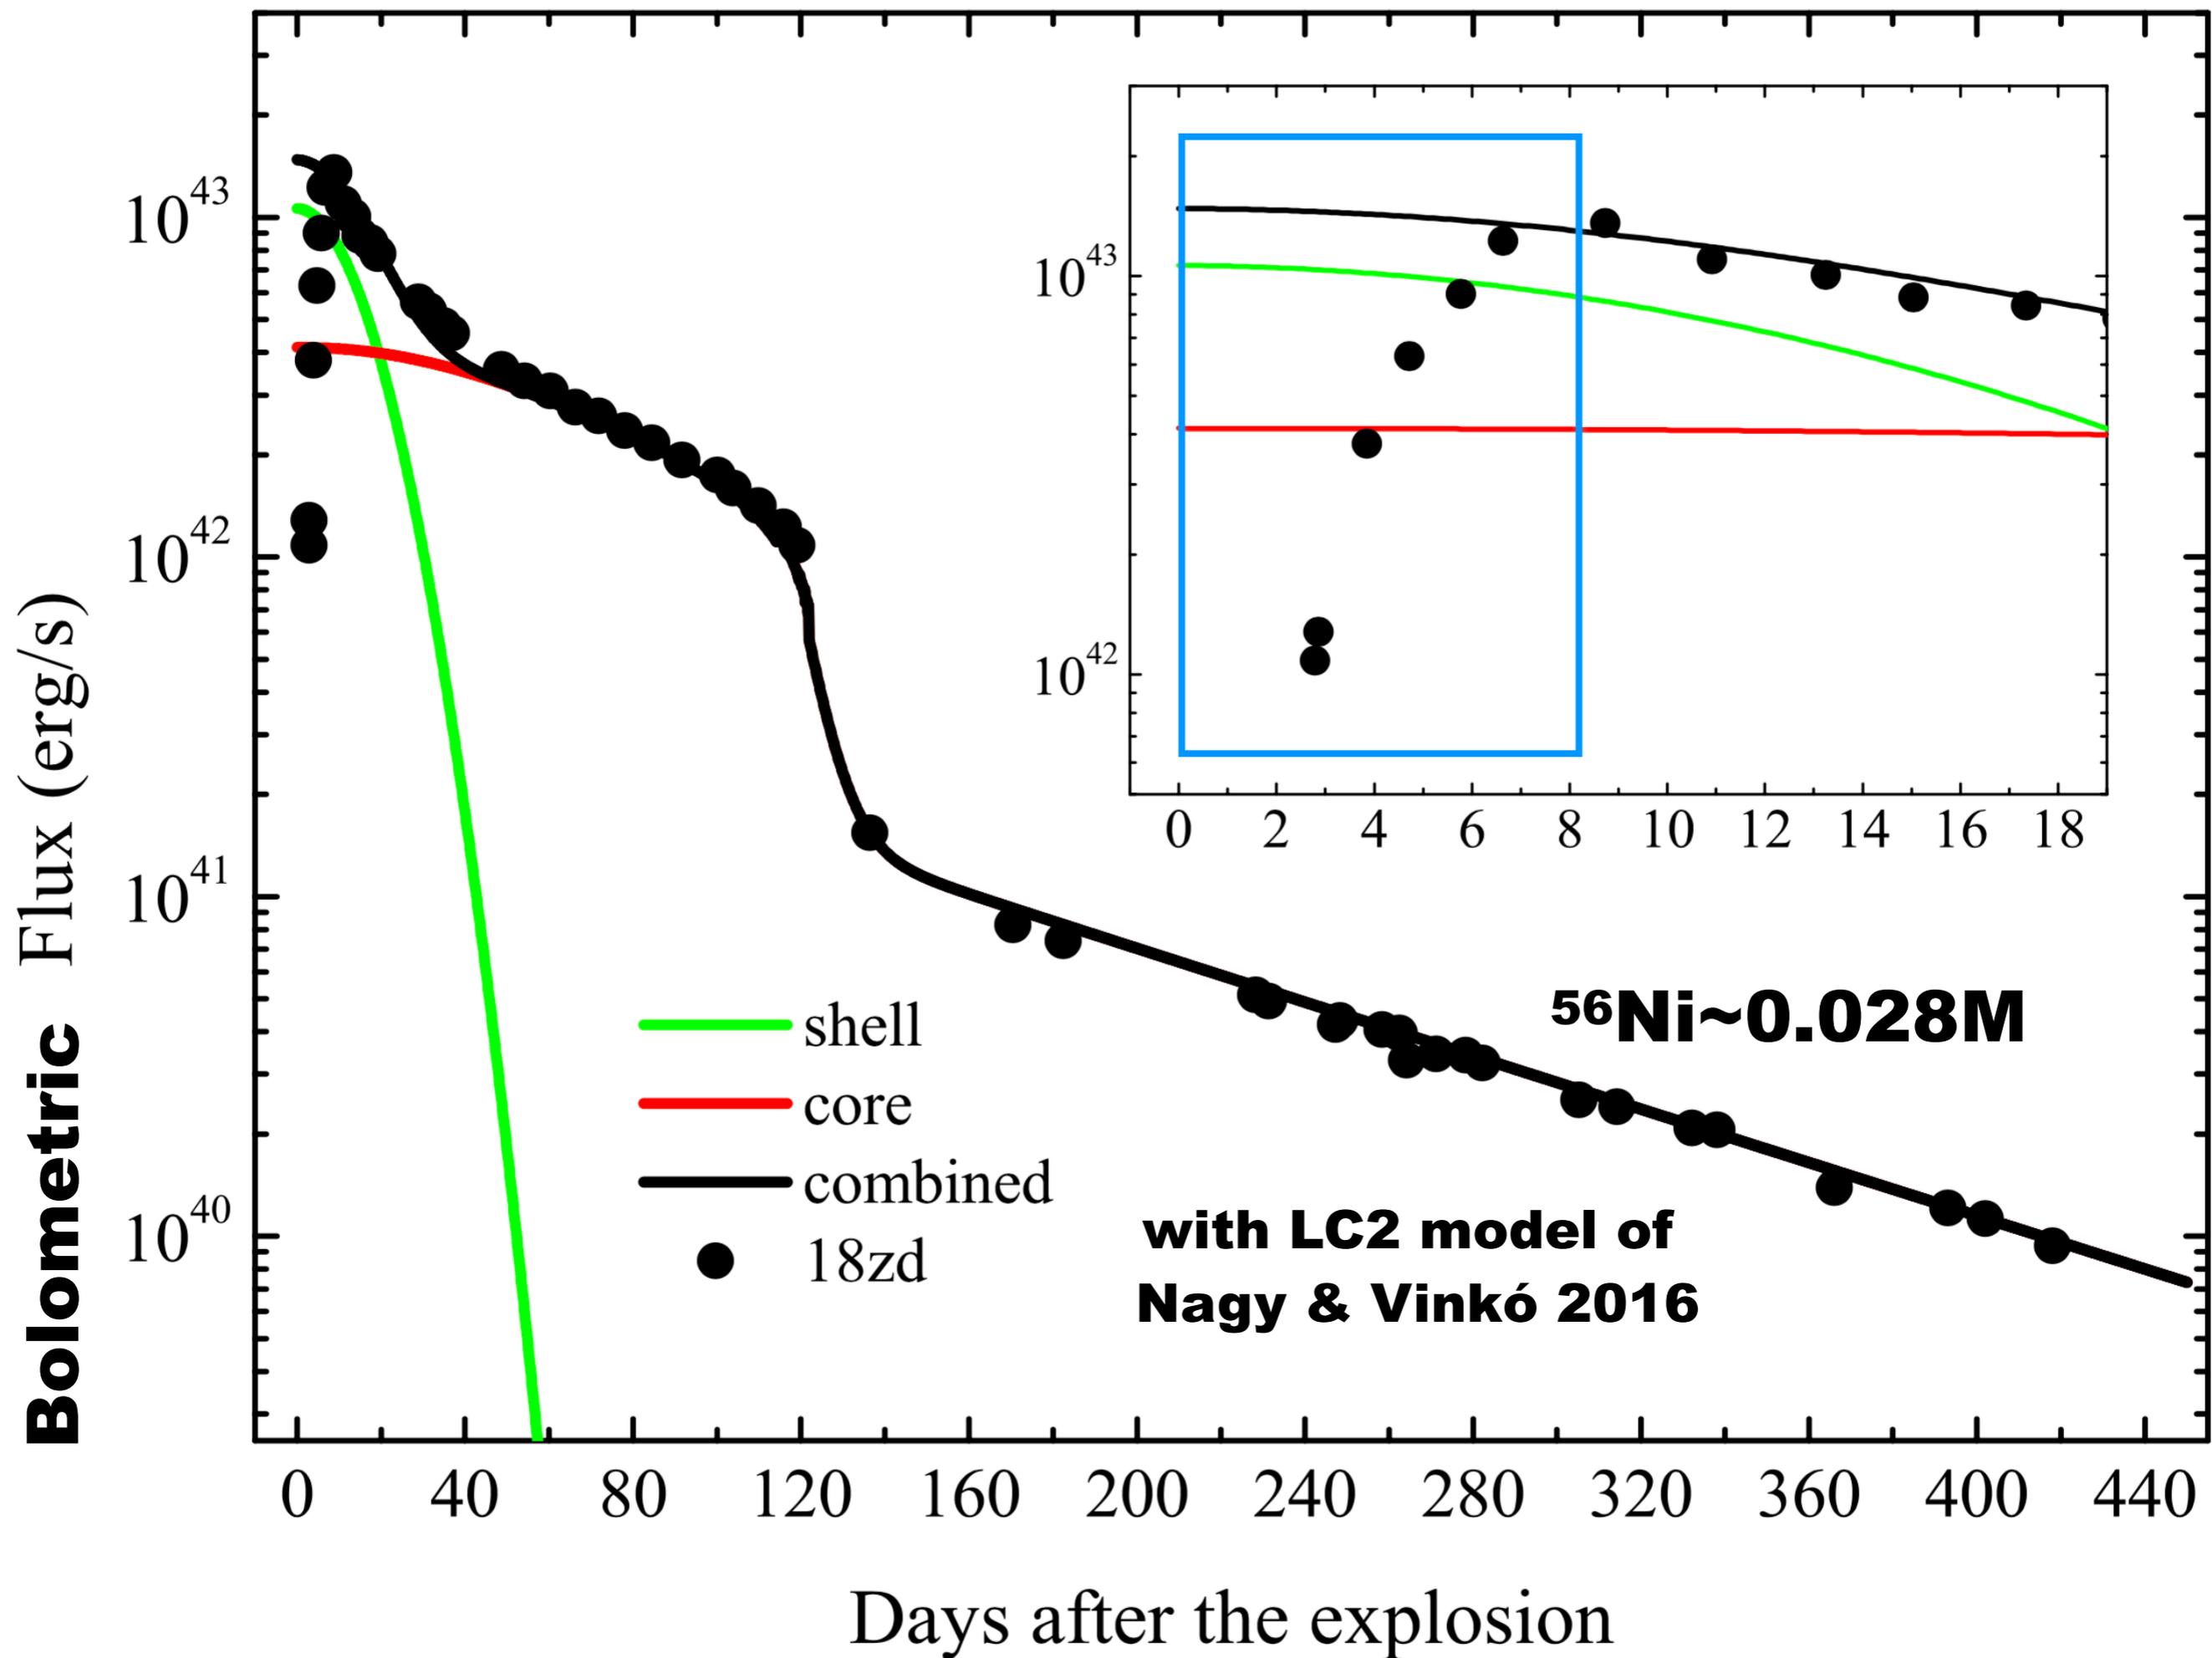

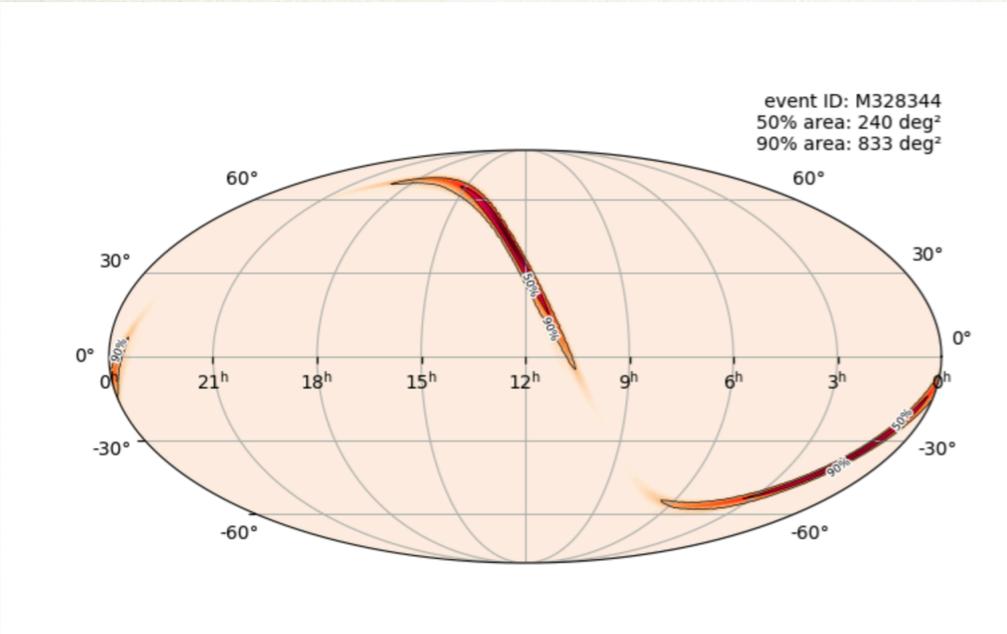

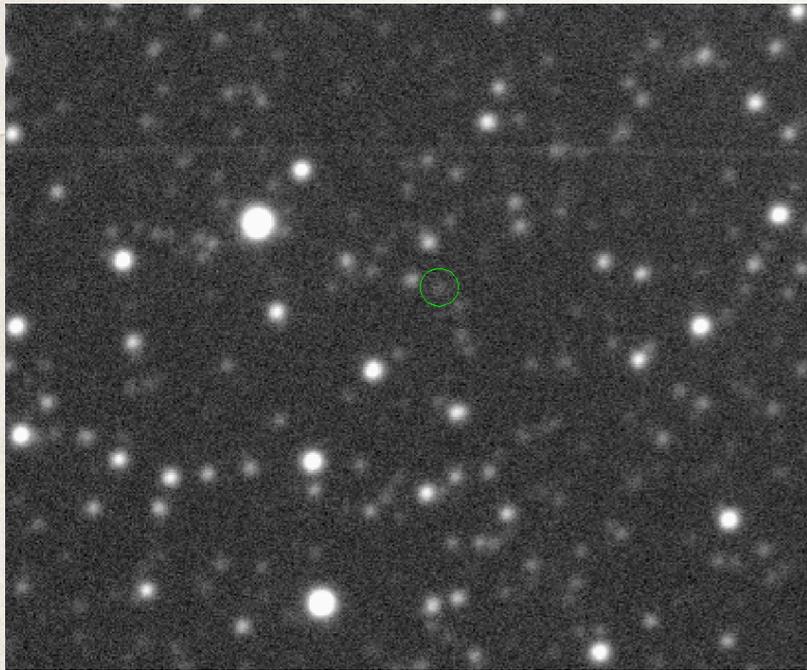

# Try to detect optical signal of GW at LJT

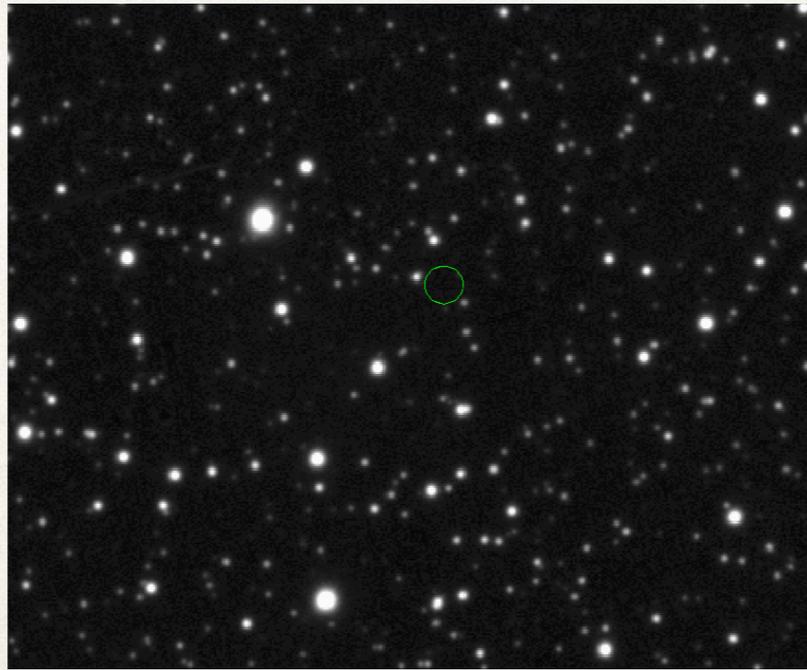

## Scan the possible galaxies located in the region of GW-alert

PanStarrs-template

On-building project at Li-Jiang Observatory

# Mephisto

## Multi-channel Photometric Survey Telescope

SWIFAR (South-Western Institute For Astronomy Research) & YNAO

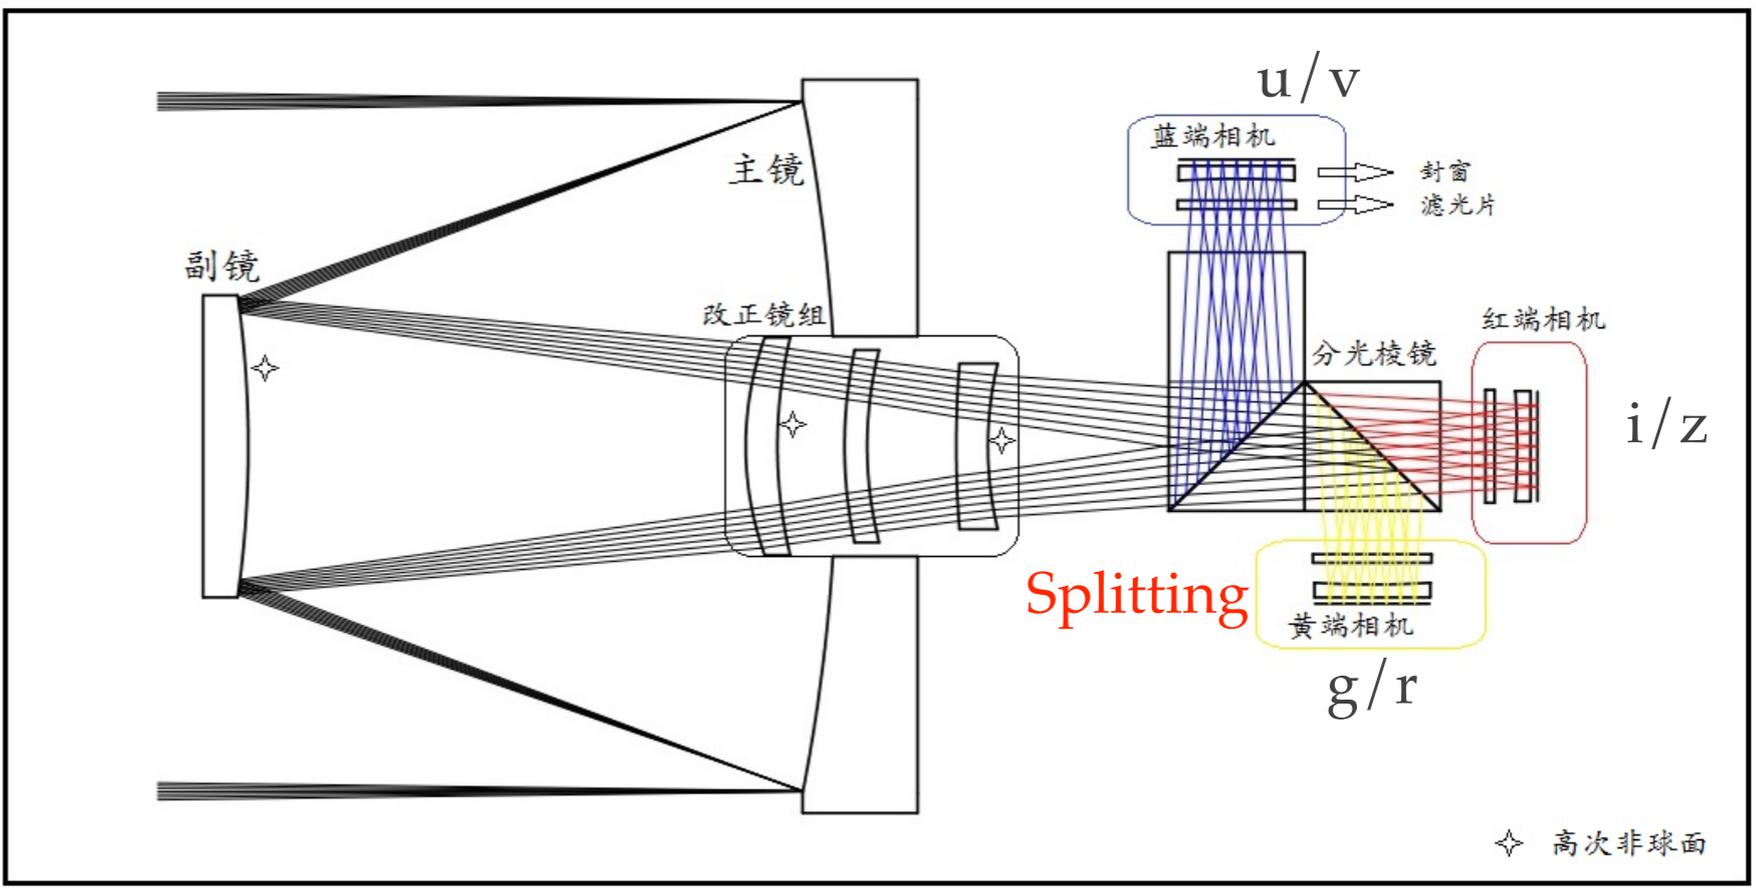

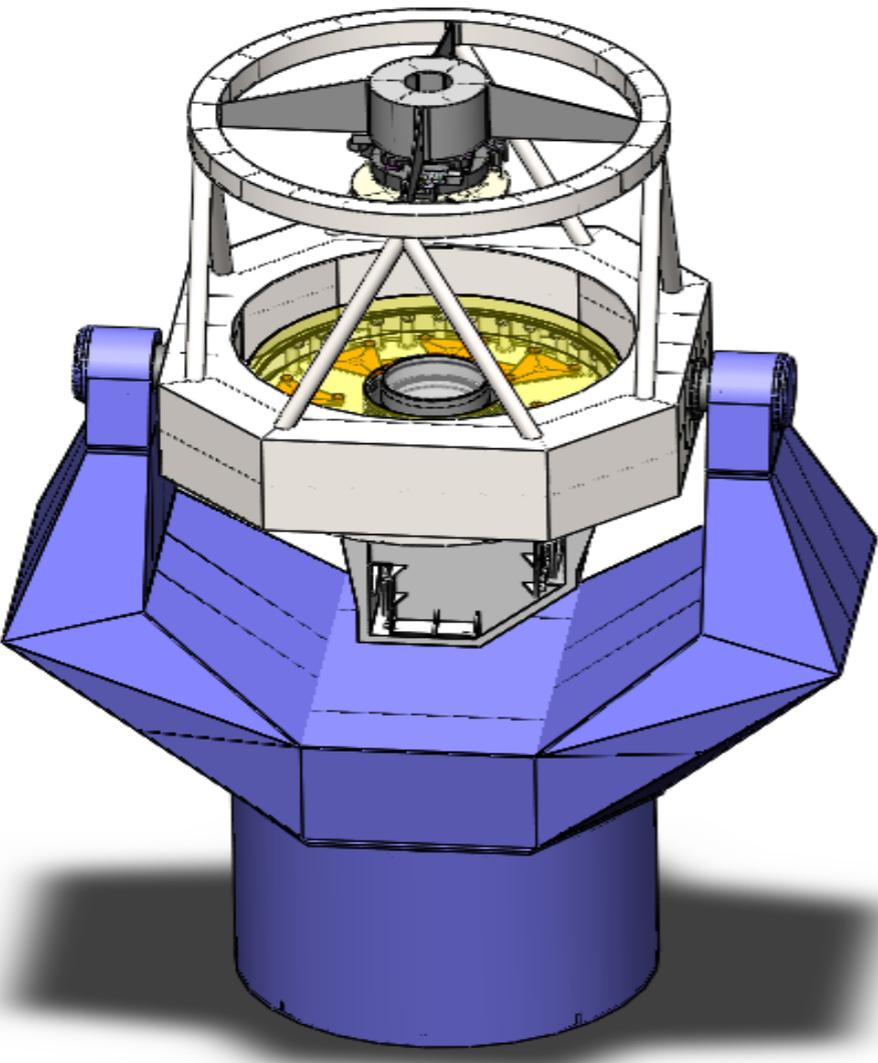

1.6 m wide field telescope (3.14deg<sup>2</sup>)

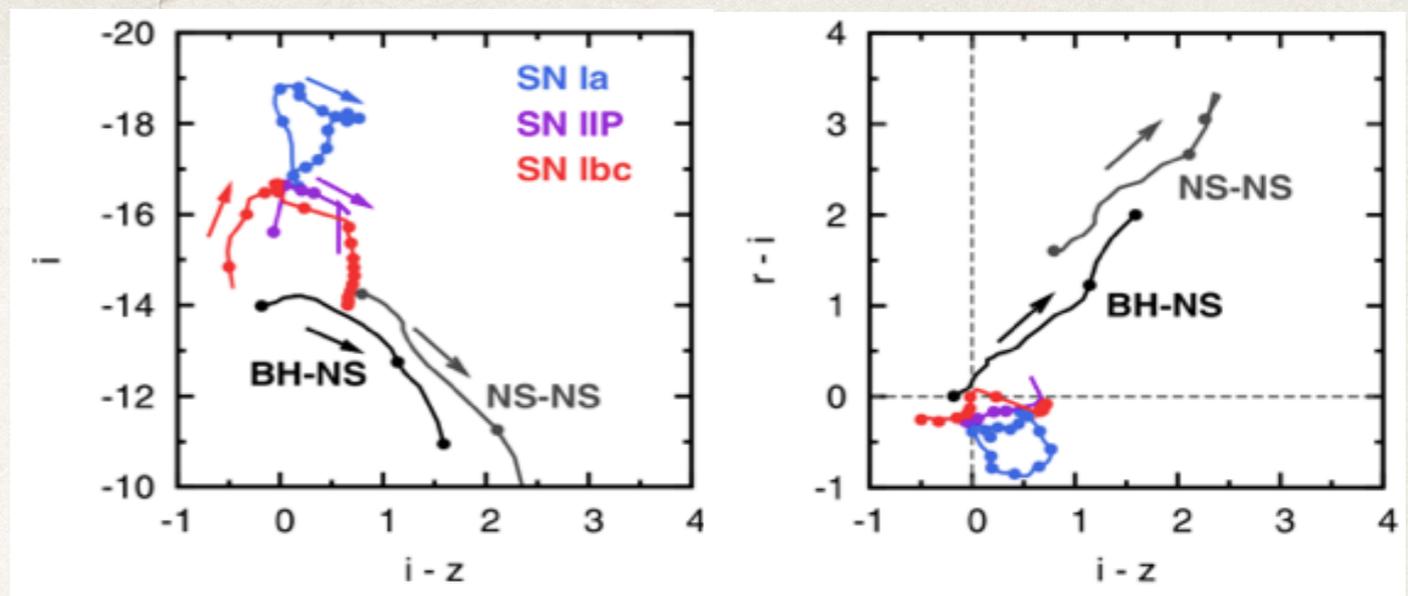

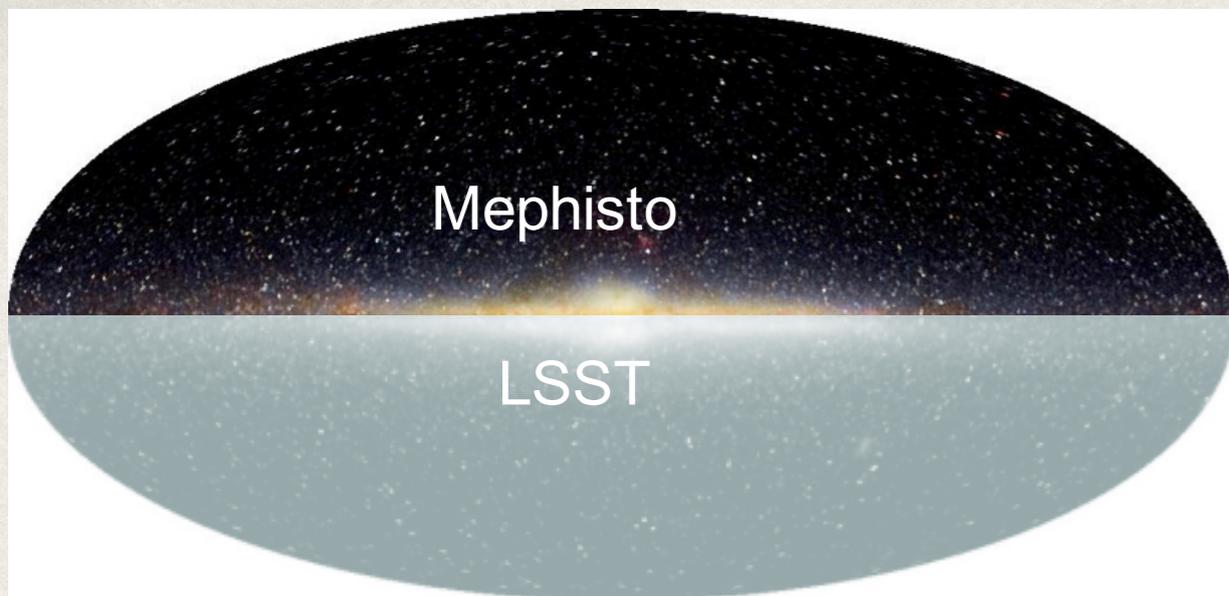

Real-time 3-colors (ugi or vrz): take real-color film of sky

1800 deg<sup>2</sup>/night

High color calibration accuracy: 0.2-0.5%

First Light at 2021, Survey since 2022

Theoretical model (Tanaka et al. 2014)

### Blue, Yellow and Red channels: Camera x 3

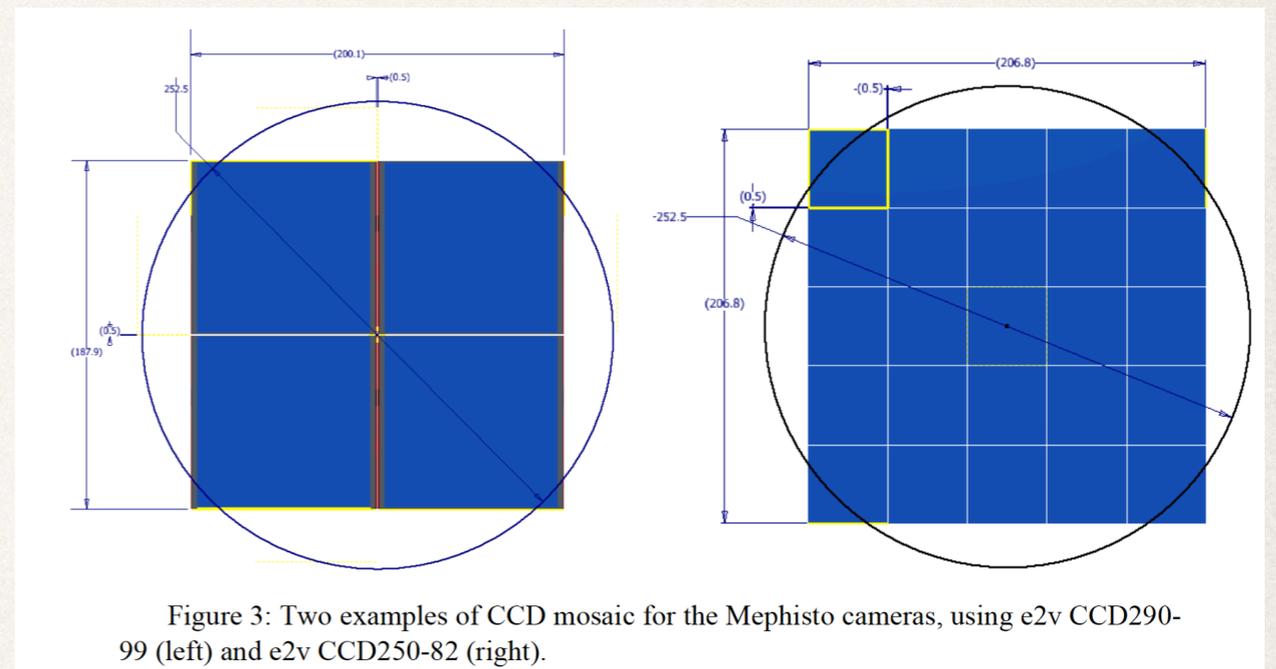

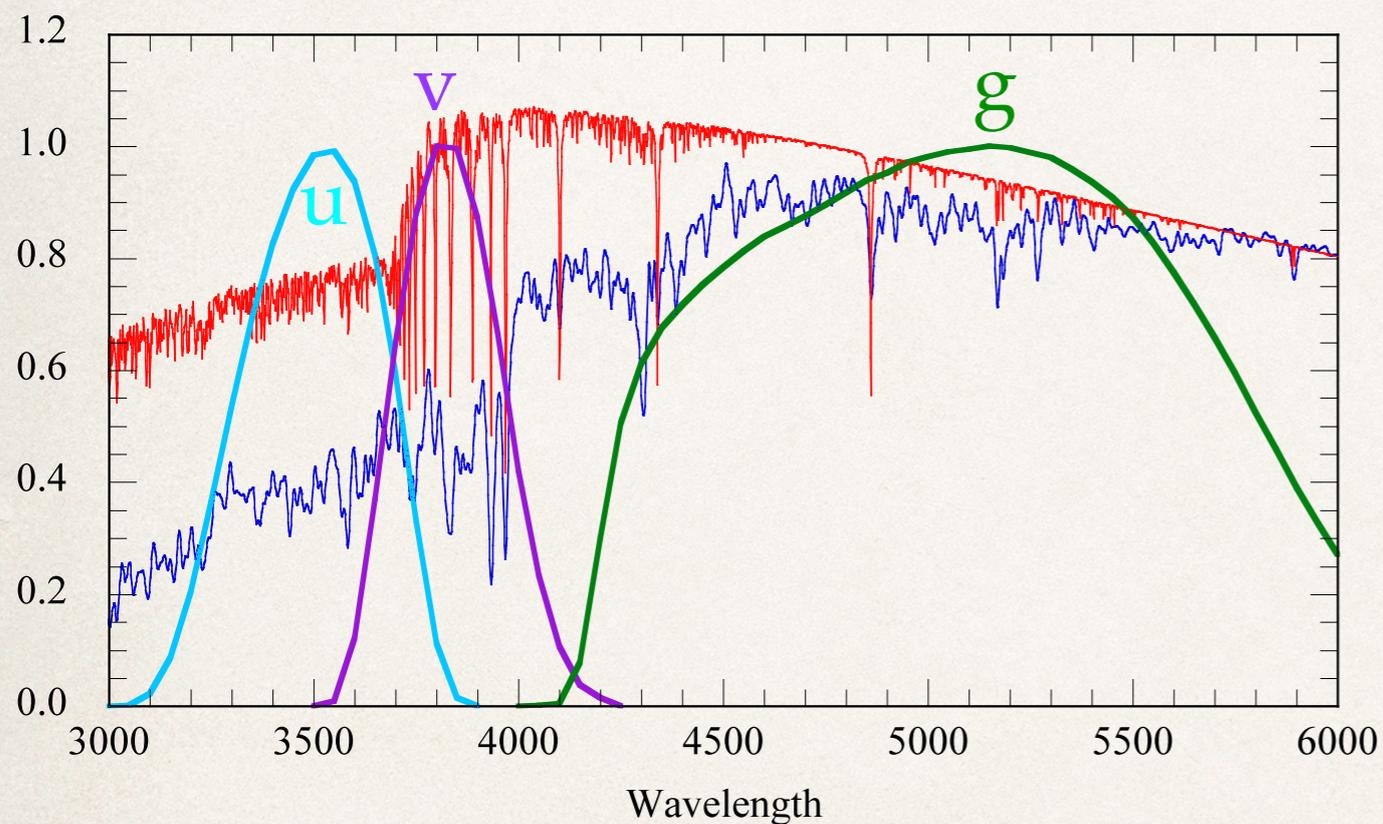

Figure 3: Two examples of CCD mosaic for the Mephisto cameras, using e2v CCD290-99 (left) and e2v CCD250-82 (right).

Mephisto	LSST
1.4 Giga pix	3.2 Giga pix
3 x 3.14 deg <sup>2</sup>	9.6 deg <sup>2</sup>
0.286"/pixel	0.2"/pix

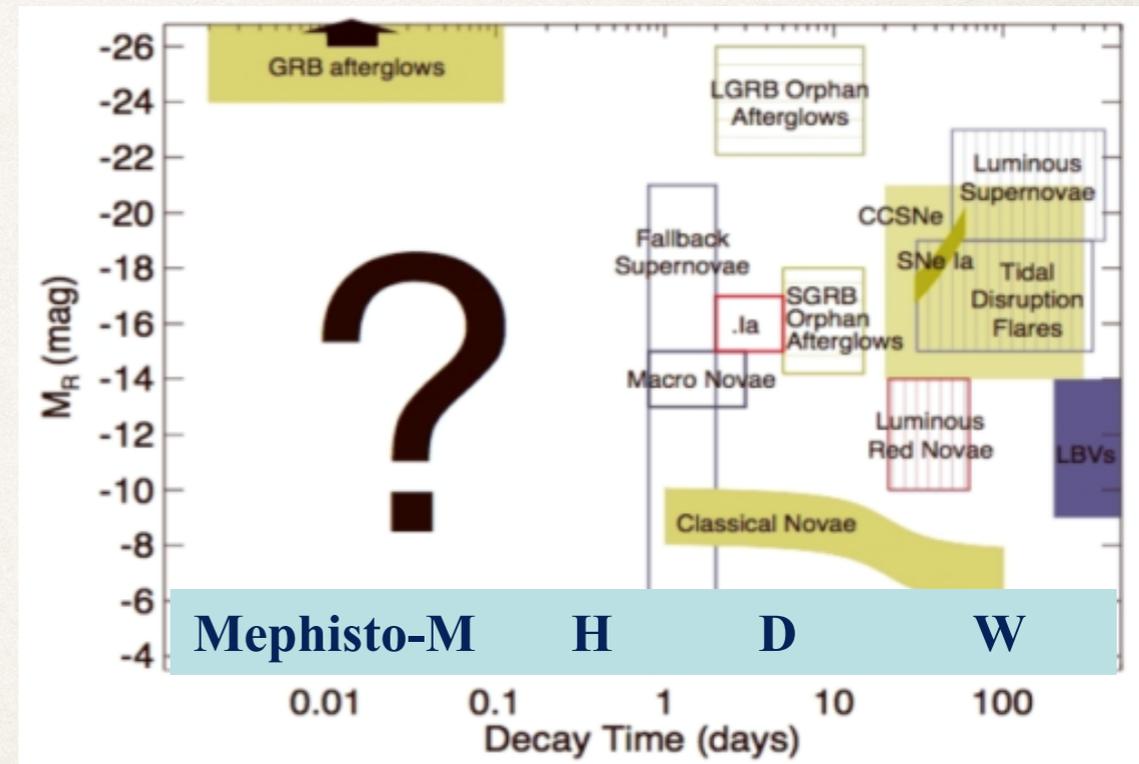

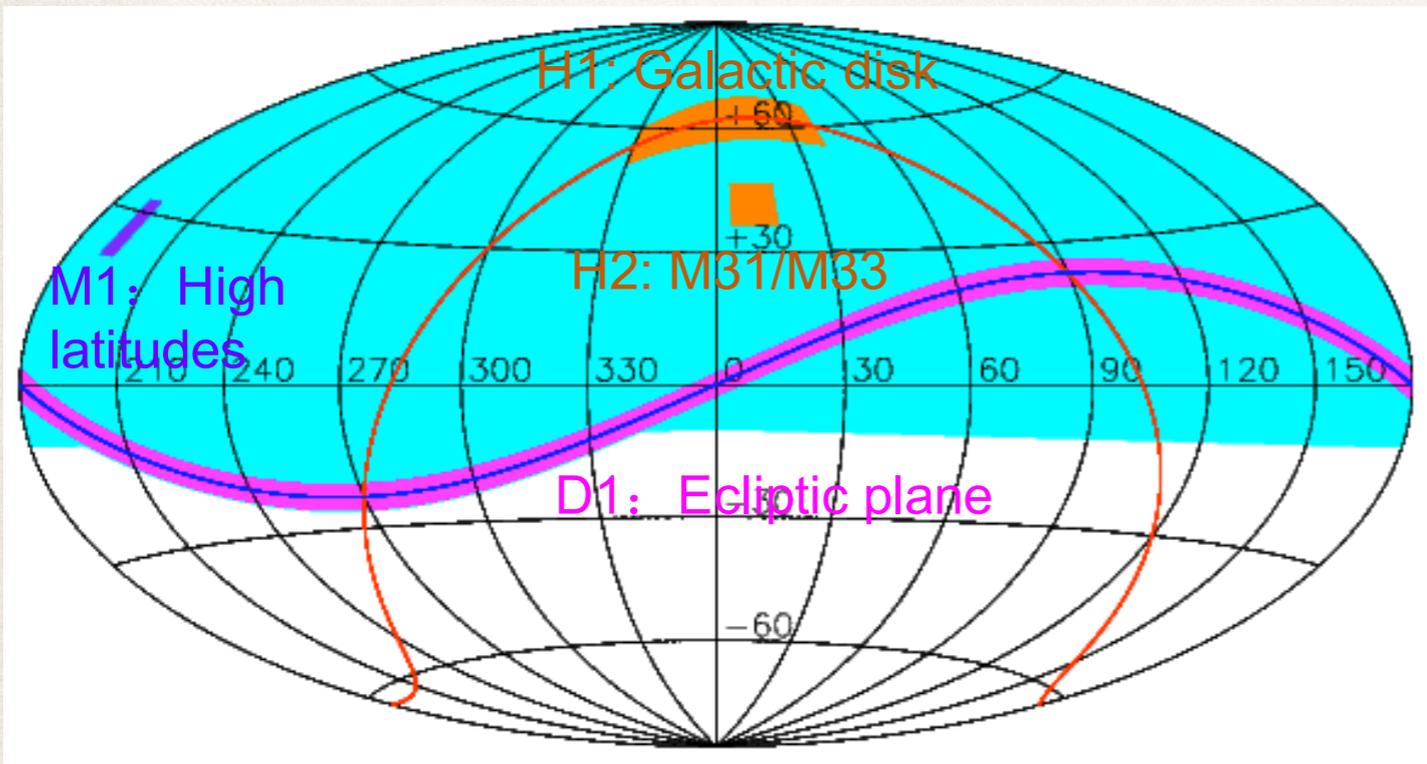

# Mephisto Survey Plan: 10 years

**W** survey: 26000 deg<sup>2</sup>, Real-color images of the North sky (whole of 2022 and 30% of 2023-2031)

**D** survey: 1800 deg<sup>2</sup> in the cadence of day

**H** survey: 180 deg<sup>2</sup> in the cadence of hour

**M** survey: 18 deg<sup>2</sup> in the cadence of minute

### 3. Blue transient survey at the New site (Daocheng-WMS无名山 4780m)

Fast iterative project: Start quickly and Keep updating

Telescope array (2x2 x n)

u&g bands (Even to NUV)

Wide-field (20 deg<sup>2</sup> for each)

High cadence (hourly, 4-5 time/night)

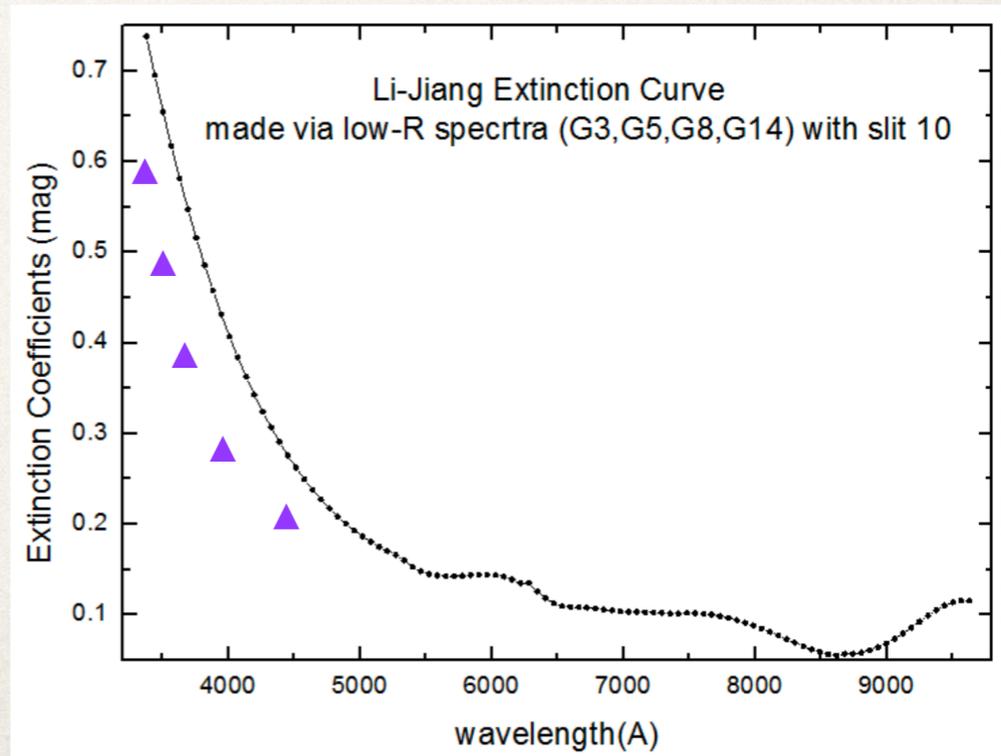

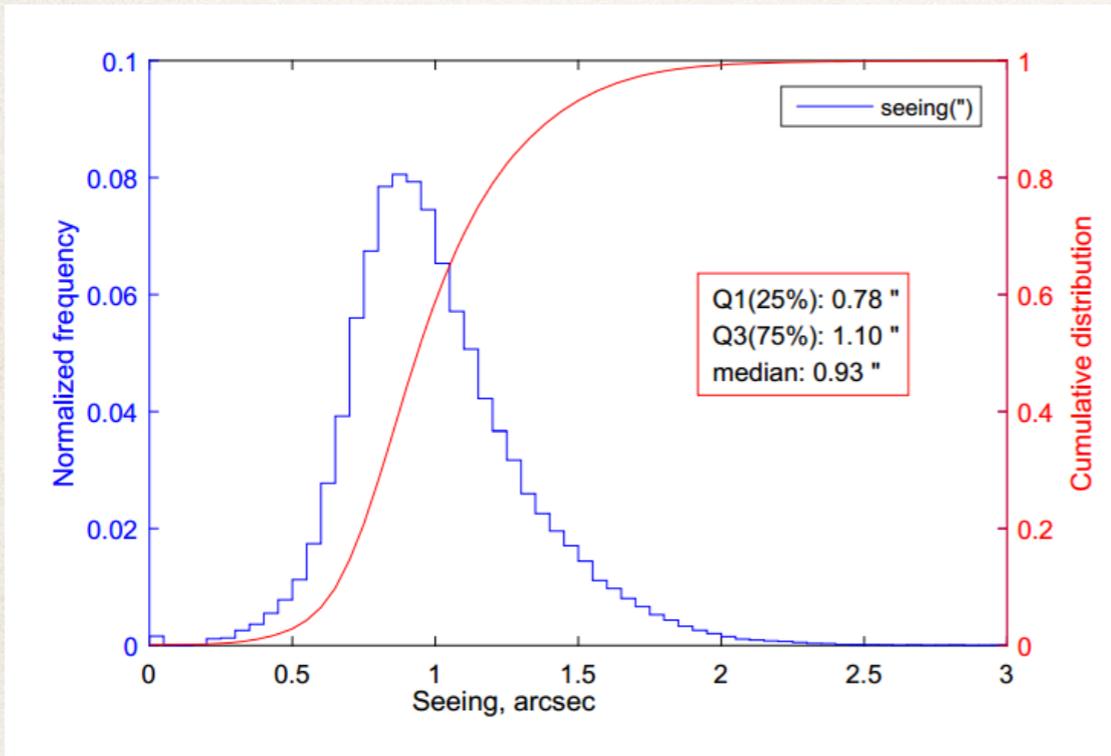

Focus on the extremely early signal of explosion

Longitude: 100 °06'32"East Latitude : 29°06'25"North  
Altitude : 4780 m (site 2)

Longitude: 100 °04'12"East Latitude : 29°09'1"North  
Altitude : 4680 m (site 1)

At the “Big data” era, astronomical data is still limited

Extremely early observation is Urgently required at the Multi-Messenger era

We hope to find the short-lived phenomenon immediately with high cadence,  
wide field survey in the Bluer band
