A formulation for the long-term evolution of EMRIs with linear order conservative self-force

Takahiro Tanaka (Kyoto university)

in collaboration with R. Fujita, S. Isoyama, A. Le Tiec, H. Nakano, N. Sago

1

Order of μ in wave form

Energy balance argument is sufficient.

$$\frac{dE_{GW}}{dt} = \frac{dE_{orbit}}{dt}$$

$$h(f) \approx A(f) e^{i\Psi(f)}$$

Wave form $\equiv \frac{df}{dt}$ for quasi-circular orbits, for example. $\frac{df}{dt} = \frac{dE_{orbit}}{dt} / \frac{dE_{orbit}}{df}$ $\frac{dE_{orbit}}{dt} = 0 + O(\mu) + O(\mu^2)$ $\frac{dE_{orbit}}{df} = (\text{geodesic}) + O(\mu) + O(\mu^2)$ $\frac{dE_{orbit}}{df} = (\text{geodesic}) + O(\mu) + O(\mu^2)$ only up to here 2

Gauge invariance

Particle's trajectory

h~µlr

Perturbation is everywhere small outside the world tube "tube radius" >> μ Unavoidable ambiguity in the perturbed trajectory of $O(\mu)$

"Self-force is gauge dependent" $F_{self}^{\mu}(\tau,\gamma)$ has unnecessary information. Source trajectory

While, "long term orbital evolution is *gauge invariant*"

There must be a concise description keeping only the gauge invariant information

$$\begin{aligned} & \underbrace{\text{Use of canonical transformation}}_{S = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau - \frac{1}{2} \int h^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\nu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)} u_{\mu} d\tau \\ & = \frac{1}{2} \int g^{\mu\nu}_{(0)$$

 $H_{(0)}=u^2/2$, and hence X^0 is τ and X^i (i = 1,2,3) are all constant for background geodesics.

4

$\frac{\text{Radiation reaction to the constants of motion}}{\text{"retarded"} = \frac{\text{"radiative"}}{2} + \frac{\text{"symmetric"}}{\text{regularization}} \\ \left\langle \frac{dP_{\alpha}}{d\tau} \right\rangle = \left\langle \frac{\partial H_{\text{int}}}{\partial X^{\alpha}} \right\rangle \approx \int d\tau \int d\tau' \frac{\partial}{\partial X^{\alpha}} G^{(ret)}(\gamma, \gamma') \bigg|_{\gamma' = \gamma}$

Geodesic preserving transformation (Mino transformation):

$$t \to -t, \ \phi \to -\phi, \ \tau \to -\tau \implies X^{\mu} \to -X^{\mu}, \quad G^{(\text{ret})} \to G^{(\text{adv})}$$

Only radiative part contributes to the change of "constants of motion" except for resonance orbits. (last Capra) which means "Orbits with different values of *X* are basically equivalent."

For resonance orbits, $X^3 = \Delta \lambda$ has physical meaning.

Second canonical transformation

{*X*} is not a good set of variables to see the orbital phase evolution.

$$X^{1} = -t \pm \int^{r} \frac{dr'}{2\Delta\sqrt{R(r',P)}} \frac{\partial R(r',P)}{\partial E} \pm \int^{\theta} \frac{d\theta'}{2\sqrt{\Theta(\theta',P)}} \frac{\partial \Theta(\theta',P)}{\partial E}$$

Small change of *P*, with fixed *X*, at a late time large variation of x

Further canonical transformation:

 $(X,P) \rightarrow (q,J)$ action-angle variables

$$\begin{split} \widetilde{W}(q,P) &= q^{t}E - q^{\phi}L_{z} - \frac{q^{r}}{2\pi} \oint \frac{\sqrt{R(r',P)}}{\Delta(r')} dr' - \frac{q^{\theta}}{2\pi} \oint \sqrt{\Theta(\theta',P)} d\theta' \\ J_{\mu} &= -\frac{\partial \widetilde{W}}{\partial q^{\mu}} \qquad X^{\alpha} = -\frac{\partial \widetilde{W}}{\partial P_{\alpha}} \\ J_{0} &= -E, J_{\phi} = L_{z}, J_{r} = \frac{1}{2\pi} \oint \frac{\sqrt{R(r',P)}}{\Delta(r')} dr', J_{\theta} = \frac{1}{2\pi} \oint \sqrt{\Theta(\theta',P)} d\theta' \end{split}$$

Physical meaning of the angle variables

$$\pm \int^{r} \frac{r^{\prime 2} dr'}{\sqrt{R(r',P)}} \pm \int^{\theta} \frac{a^{2} \cos^{2} \theta'}{\sqrt{\Theta(\theta',P)}} d\theta' = X^{0} = \frac{q^{r}}{2\pi} \oint \frac{r^{\prime 2} dr'}{\sqrt{R(r',P)}} + \frac{q^{\theta}}{2\pi} \oint \frac{a^{2} \cos^{2} \theta'}{\sqrt{\Theta(\theta',P)}} d\theta'$$
$$\mp \int^{r} \frac{dr'}{2\sqrt{R(r',P)}} \pm \int^{\theta} \frac{d\theta'}{\sqrt{\Theta(\theta',P)}} = X^{3} = -\frac{q^{r}}{2\pi} \oint \frac{dr'}{2\sqrt{R(r',P)}} + \frac{q^{\theta}}{2\pi} \oint \frac{d\theta'}{2\sqrt{\Theta(\theta',P)}}$$

After n^r and n^{θ} cycles, $q^r = 2\pi n^r$, $q^{\theta} = 2\pi n^{\theta}$, irrespective of $\{-E, L_z, Q\}$.

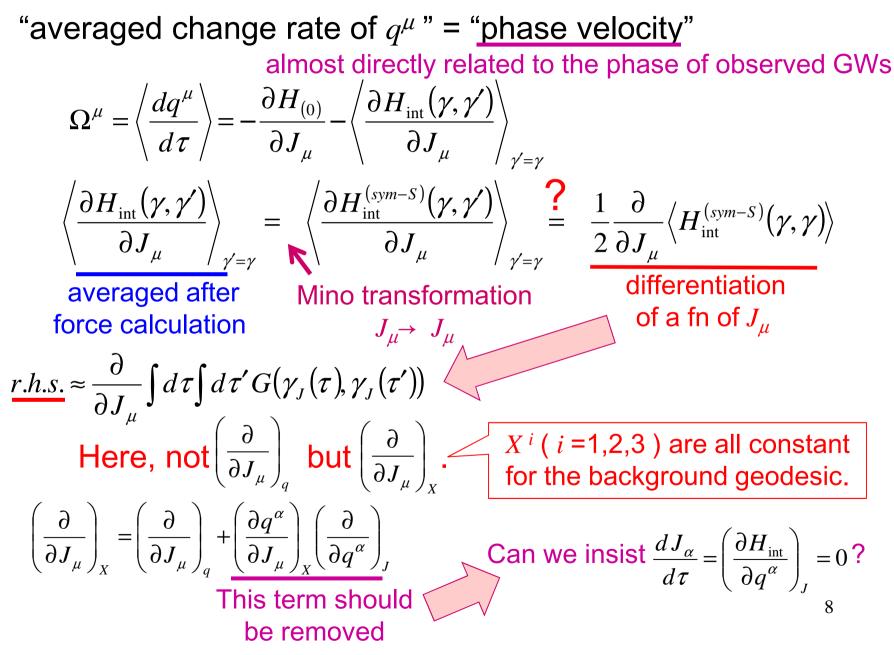

Small change in J (or in P) with fixed $X^i \longrightarrow$ small variation of x

$$t \mp \int^{r} \frac{dr'}{2\Delta\sqrt{R(r',P)}} \mp \int^{\theta} \frac{d\theta'}{2\sqrt{\Theta(\theta',P)}} = q^{t} + \frac{q^{r}}{2\pi} \oint \frac{dr'}{2\Delta\sqrt{R(r',P)}} + \frac{q^{\theta}}{2\pi} \oint \frac{d\theta'}{2\sqrt{\Theta(\theta',P)}}$$

 $t - q^t$ is a periodic function w.r.t. q^r, q^{θ} .

 q^{μ} is gauge invariant in the context of long term evolution. which allows an $O(\mu)$ error at each time, but the error should not accumulate.

Phase velocity

Perturbation of generating function

Yes! " J_{μ} =constant" can be realized by an appropriate gauge transformation, $x^{\mu} \rightarrow x^{\mu} - \xi^{\mu}$, without secular growth of ξ^{μ} .

$$\delta_{\xi} J_{\alpha} = -\left(\frac{\partial J_{\alpha}}{\partial u_{\nu}}\right)_{x} \left(\frac{\partial \left(\xi^{\rho} u_{\rho}\right)}{\partial x^{\nu}}\right)$$

The same transformation can be achieved by $\delta \widetilde{W}(x(q, P), J(P)) = \xi^{\mu}u_{\mu}$

$$-\left(\frac{\partial(\delta \widetilde{W})}{\partial q^{\alpha}}\right)_{J} = -\left(\frac{\partial(\delta \widetilde{W})}{\partial x^{\nu}}\right)_{J} \left(\frac{\partial x^{\nu}}{\partial q^{\alpha}}\right)_{J} \qquad (:) \quad \left(\frac{\partial q^{\alpha}}{\partial x^{\nu}}\right)_{J} = \frac{\partial^{2} \Phi(x, J)}{\partial J_{\alpha} \partial x^{\nu}} = \left(\frac{\partial u_{\nu}}{\partial J_{\alpha}}\right)_{x}$$

Additional $\delta \widetilde{W}$ makes J_{μ} constant.
$$(:) \quad \left(\frac{\partial H_{\text{int}}}{\partial q^{\alpha}}\right)_{J} = 0$$

$$\left(\frac{\partial H_{\text{int}}}{\partial J_{\mu}}\right)_{\gamma=\gamma} = -\frac{1}{2}\frac{\partial}{\partial J_{\mu}}\left\langle H_{\text{int}}^{(sym-S)}(\gamma,\gamma)\right\rangle$$

$$(:) \quad \left(\frac{\partial q^{\alpha}}{\partial x^{\nu}}\right)_{J} = 0$$

$$\Omega^{\mu} = \Omega_{(0)}^{\mu}(J + \delta_{\xi}J) - \frac{1}{2}\frac{\partial}{\partial J_{\mu}}\left\langle H_{\text{int}}^{(sym-S)}(\gamma,\gamma)\right\rangle$$

L.h.s. is gauge inv. (δq caused by δW is purely oscillatory) while r.h.s. may look a gauge-independent fn. of J. J was originally gauge dependent but $J + \delta_{\xi} J$ must be gauge invarian? Why does $\dot{J} = 0$ fix the gauge completely?

$$\delta_{\xi} J_{\alpha} = -\left(\frac{\partial J_{\alpha}}{\partial u_{\nu}}\right)_{x} \left(\frac{\partial \left(\xi^{\rho} u_{\rho}\right)}{\partial x^{\nu}}\right)_{J}$$

Let's consider the above gauge transformation at the reflection point of Mino transformation,

where $u_r = u_\theta = 0$.

From the symmetry, $(\xi^{\rho}u_{\rho})=0$ at the reflection point.

$$\left(\frac{\partial\left(\xi^{\rho}u_{\rho}\right)}{\partial r}\right)_{J} = \left(\frac{\partial\left(\xi^{\rho}u_{\rho}\right)}{\partial \theta}\right)_{J} = 0$$

Normalization condition $u^{\nu}\left(\frac{\partial\left(\xi^{\rho}u_{\rho}\right)}{\partial x^{\nu}}\right)_{J} = 0$ $u^{t}\delta_{\xi}E = u^{\phi}\delta_{\xi}L$

10

By considering two approximate reflection points corresponding to r_{min} and r_{max} , we can conclude that constant shift of J_{α} is not allowed.

<u>Conclusion</u>

We discussed the effect of long-term evolution due to first order self-force.

Radiative part requires no regularization.

The contribution of symmetric part is concisely encoded in gaugeinvariant interaction Hamiltonian:

$$\left\langle H_{\text{int}}^{(sym-S)} \right\rangle (J) \approx \int d\tau \int d\tau' u^{\mu}(\tau) u^{\nu}(\tau) G_{\mu\nu\rho\sigma}^{(sym-S)}(x(\tau), x(\tau')) u^{\rho}(\tau') u^{\sigma}(\tau')$$

Evolution of *Q* in the resonance case can be also described by a similar quantity:

$$\left\langle H_{\mathrm{int}}^{(sym-S)}\right\rangle (J,\Delta\lambda)$$

Instead of the direct computation of the self-force, alternative simple regularization based on H_{int} might be handy.

Scalar quantity. Lower order differentiation. Time integral can be performed first.
