

How do we **correctly identify TDEs** observationally and avoid impostors?

Super Eddington accretion - smoking gun in observations independently of BH mass estimate?

Critical observation(s) to distinguish **reprocessing vs. outer shocks** power sources for optical / UV emission?

Criteria for identifying TDEs in surveys - could some (e.g. blue, not in AGN) be **biasing our samples**? What should we be careful of?

Observational signatures of **partial disruptions**?
