Exotic Hadrons in s-Wave Chiral Dynamics

Tetsuo Hyodo[a]

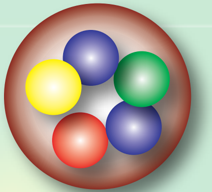
D. Jido[a], **and A. Hosaka**[b]

YITP, Kyoto[a] *RCNP, Osaka*[b]

2006, Dec. 22nd

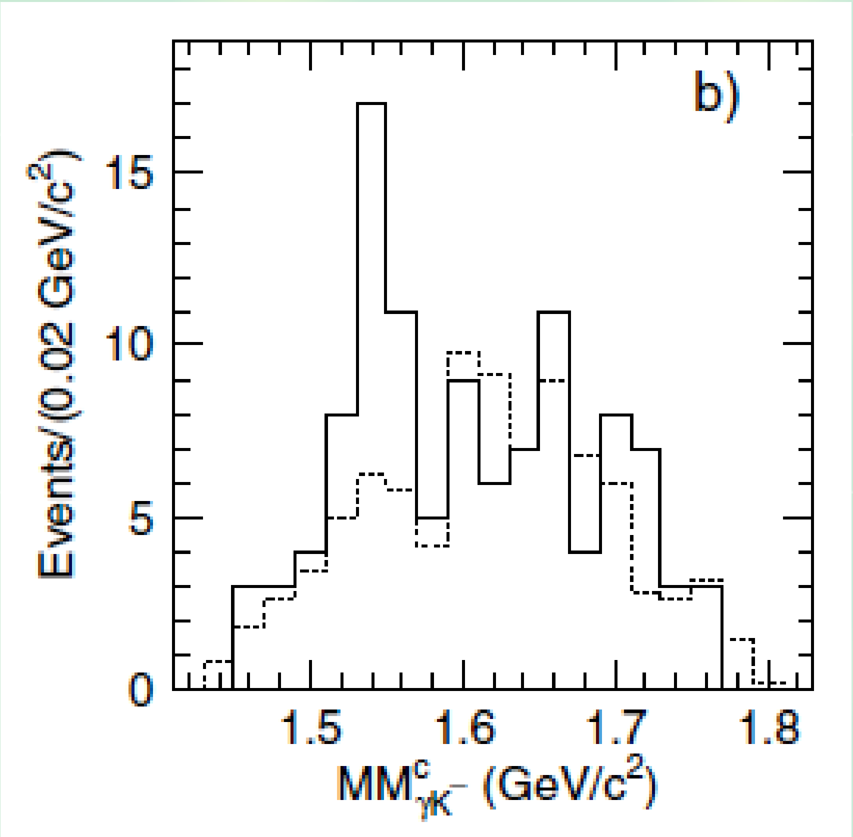
Pentaquark Θ^+

Θ^+ : $uudd\bar{s}$ state



S = +1
Candidate for a manifestly exotic hadron

$$\gamma n \to K^- K^+ n \quad \text{in } C$$

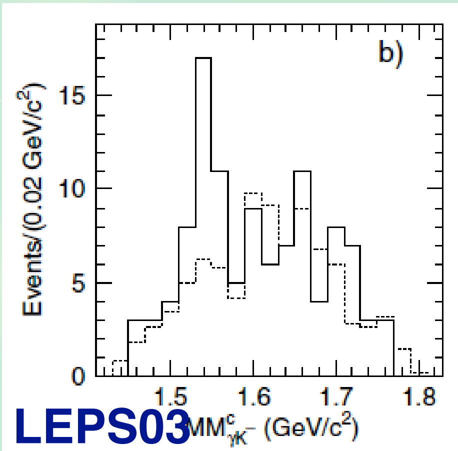


LEPS2003

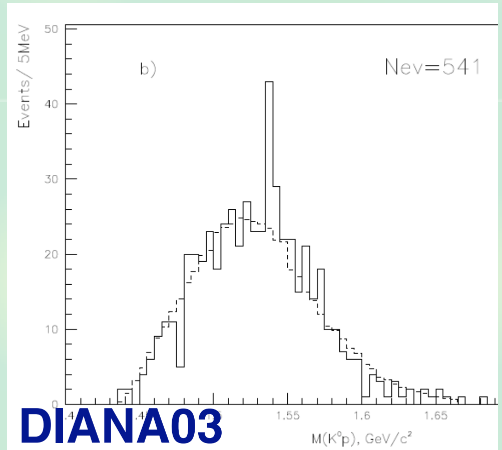
-> Experimental situation?

Status of pentaquark Θ^+

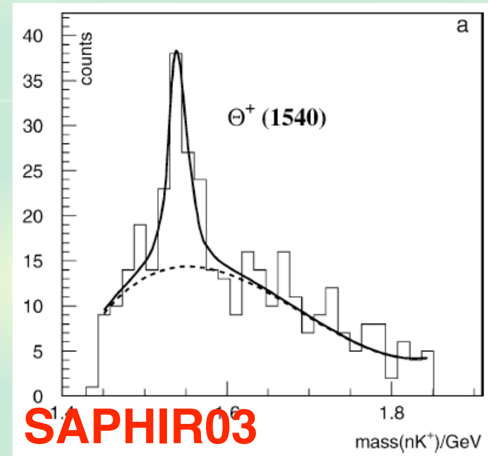
2003 ~ 2004 : 6 positive results



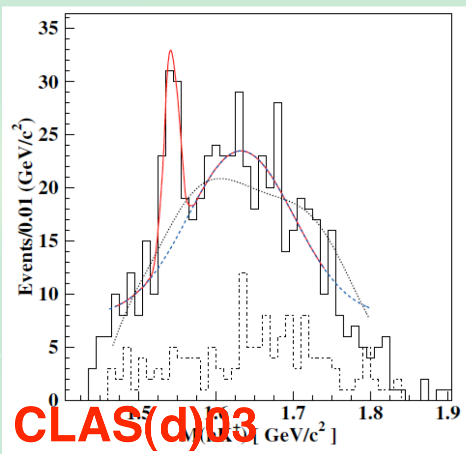
LEPS03



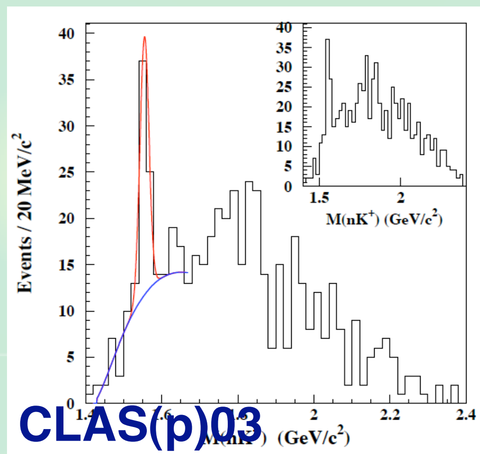
DIANA03



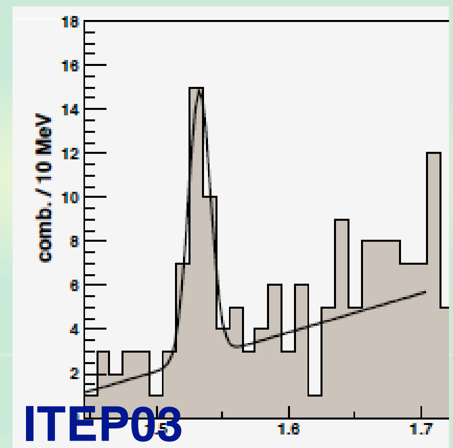
SAPHIR03



CLAS(d)03



CLAS(p)03



ITEP03

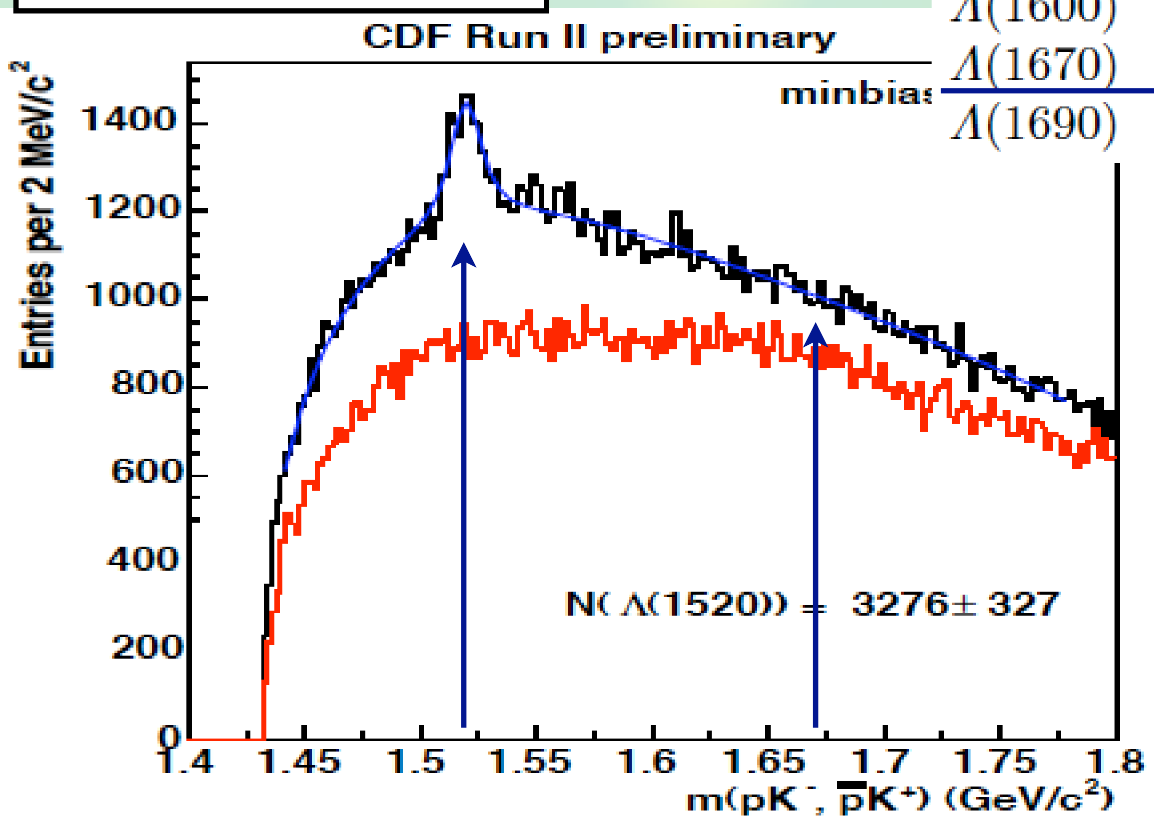
$\Lambda(1690)$	D_{03}	****	****

Γ = 15 MeV

Γ = 35 MeV

CDF
1.96 TeV $p\bar{p}$



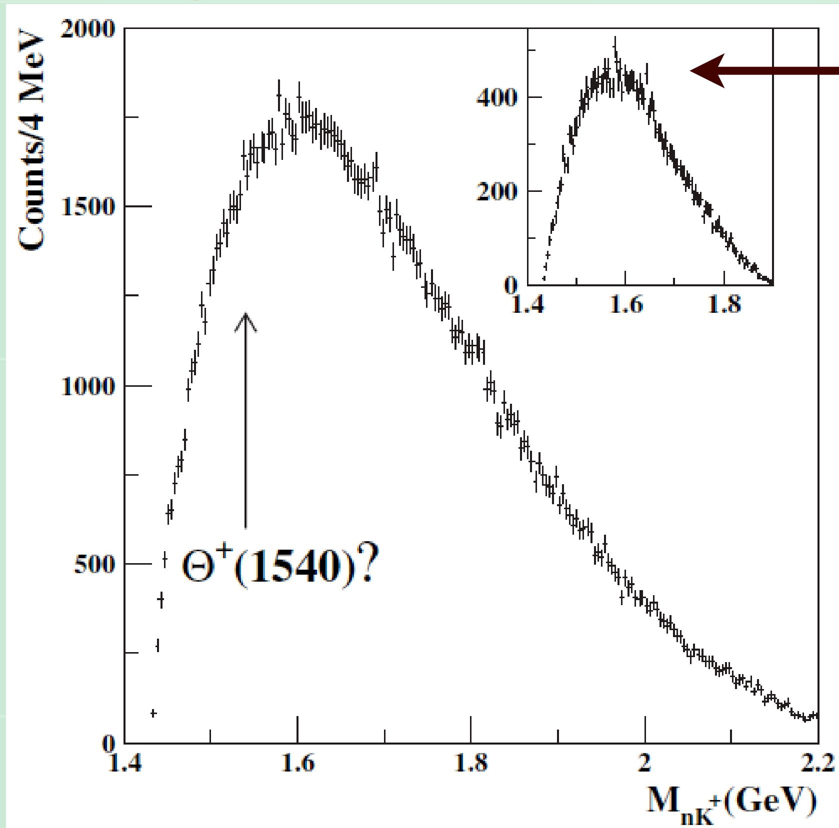
Same argument:
$\Sigma(1670)$ in K^0p?
Γ = 60 MeV

Status of pentaquark Θ⁺

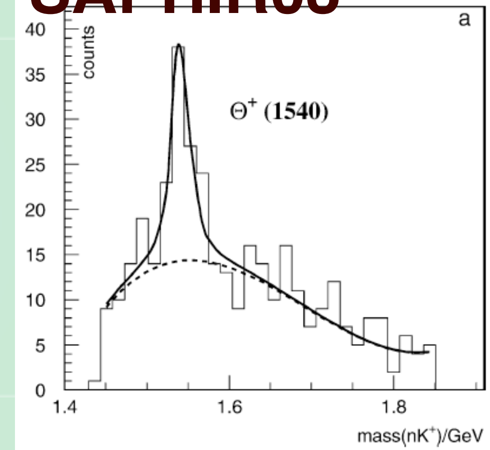
~ present : 14 positive results,
13 negative (also in low energy)

CLAS06

$\gamma p \to \bar{K}^0 K^+ n$



Same kinematical cuts with SAPHIR03



Citation: W.-M. Yao *et al.* (Particle Data Group), J. Phys. G **33**, 1 (2006) (URL: http://pdg.lbl.gov)

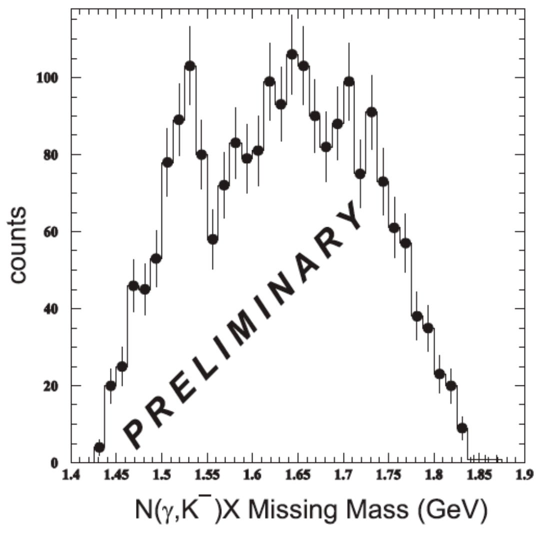
$\Theta(1540)^+$ $I(J^P) = 0(?^?)$ Status: *

Status of pentaquark Θ+

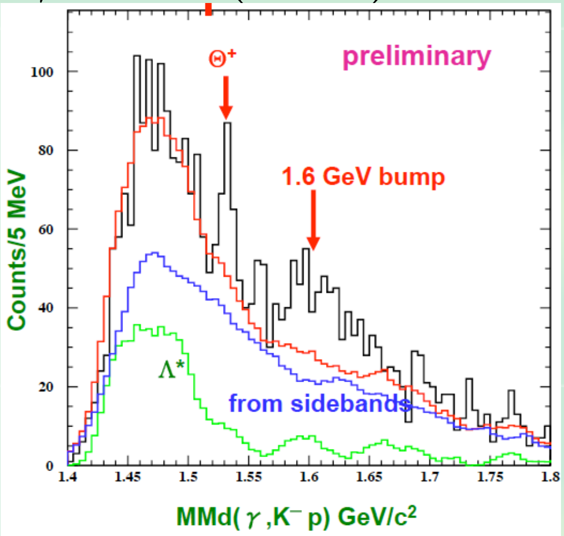
New positive(?) results:

LEPS

$\gamma n \to K^- K^+ n \quad \text{in } d$



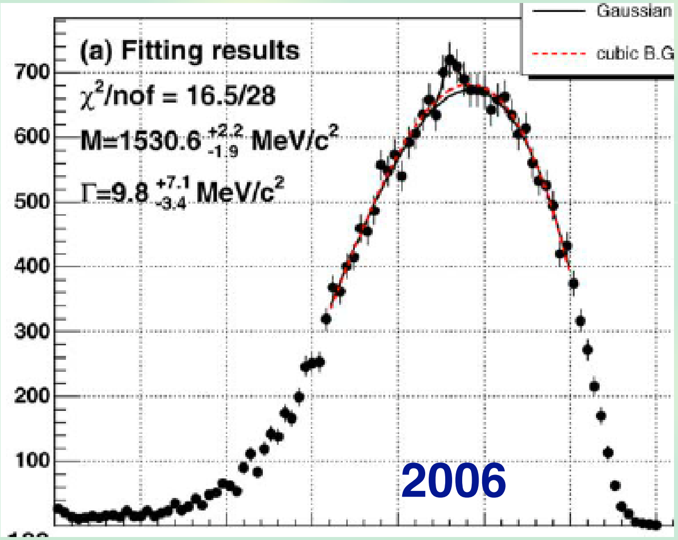
$\gamma d \to \Lambda(1520) K N$



See Titov et al, PRC2006

KEK

$\pi^- p \to K^- X$

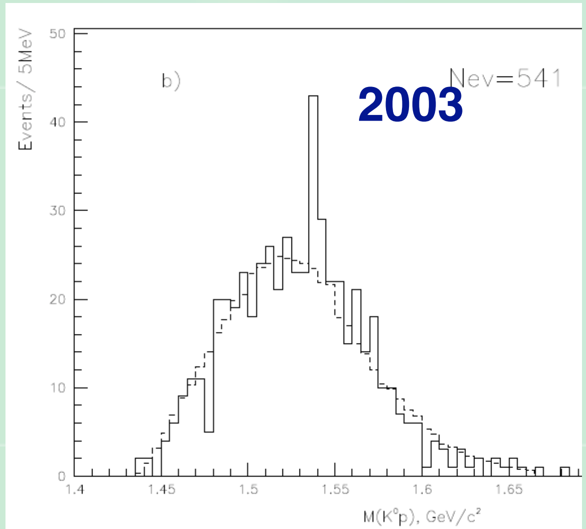


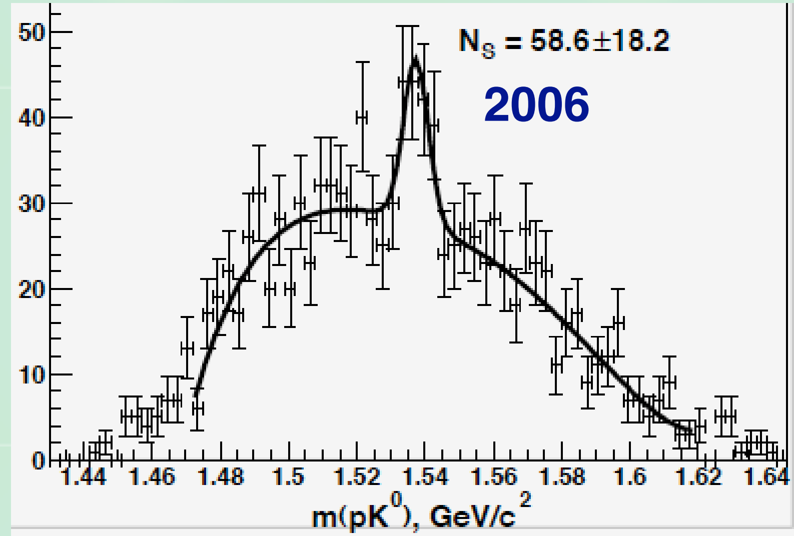
Status of pentaquark Θ^+

Updated positive results:

DIANA

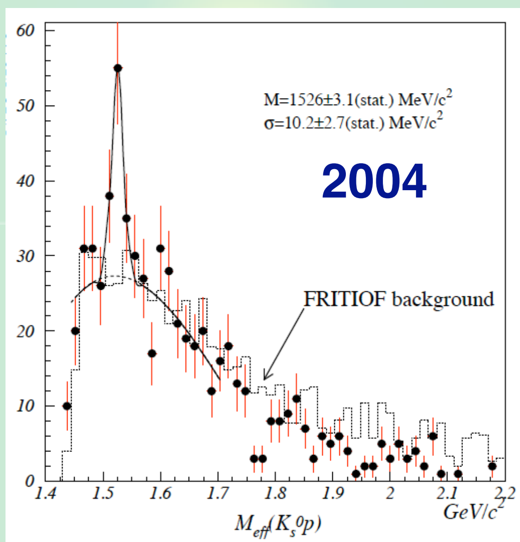
$K^+ n \to K^0 p \quad \text{in } Xe$

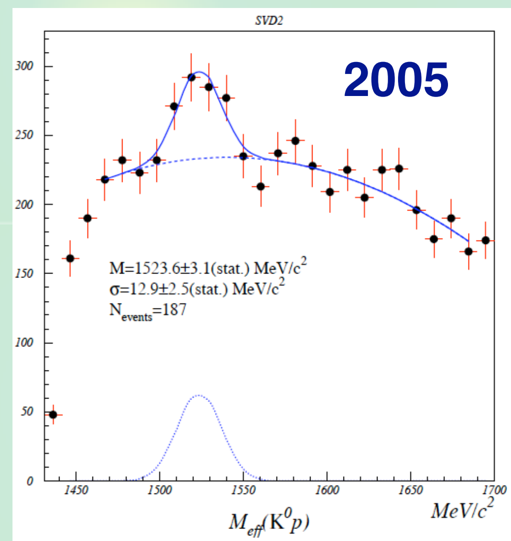




SVD

$pA \to pK^0_s + X$



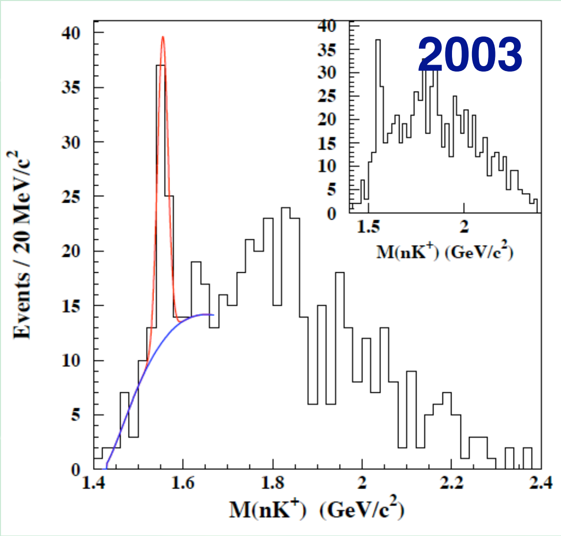


Status of pentaquark Θ+

Remaining (not yet denied) positive results:

CLAS(p)

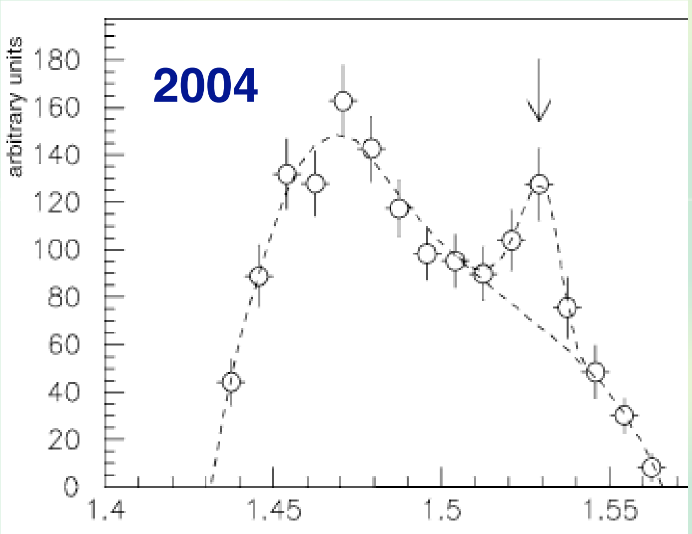
$$\gamma p \rightarrow \pi^+ K^- K^+ n$$



7 sigma!!
The experiment will be run in 2007

COSY-TOF

$$pp \rightarrow pK^0\Sigma^+$$



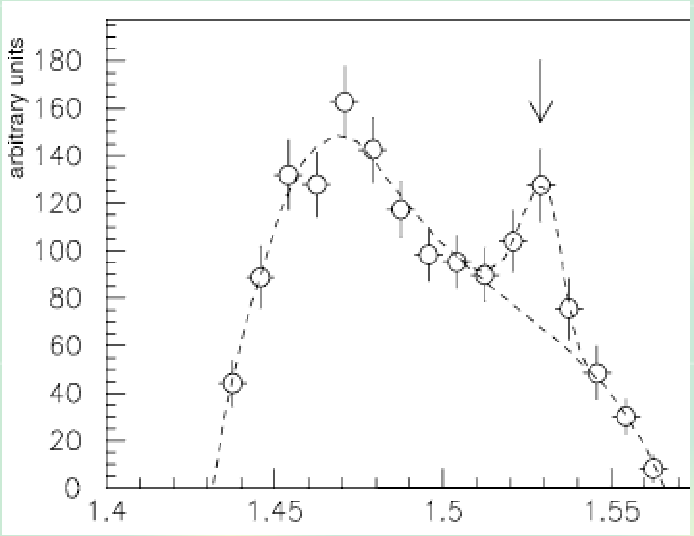
4-6 sigma
Large no. of events!!

YESTERDAY new data came up...

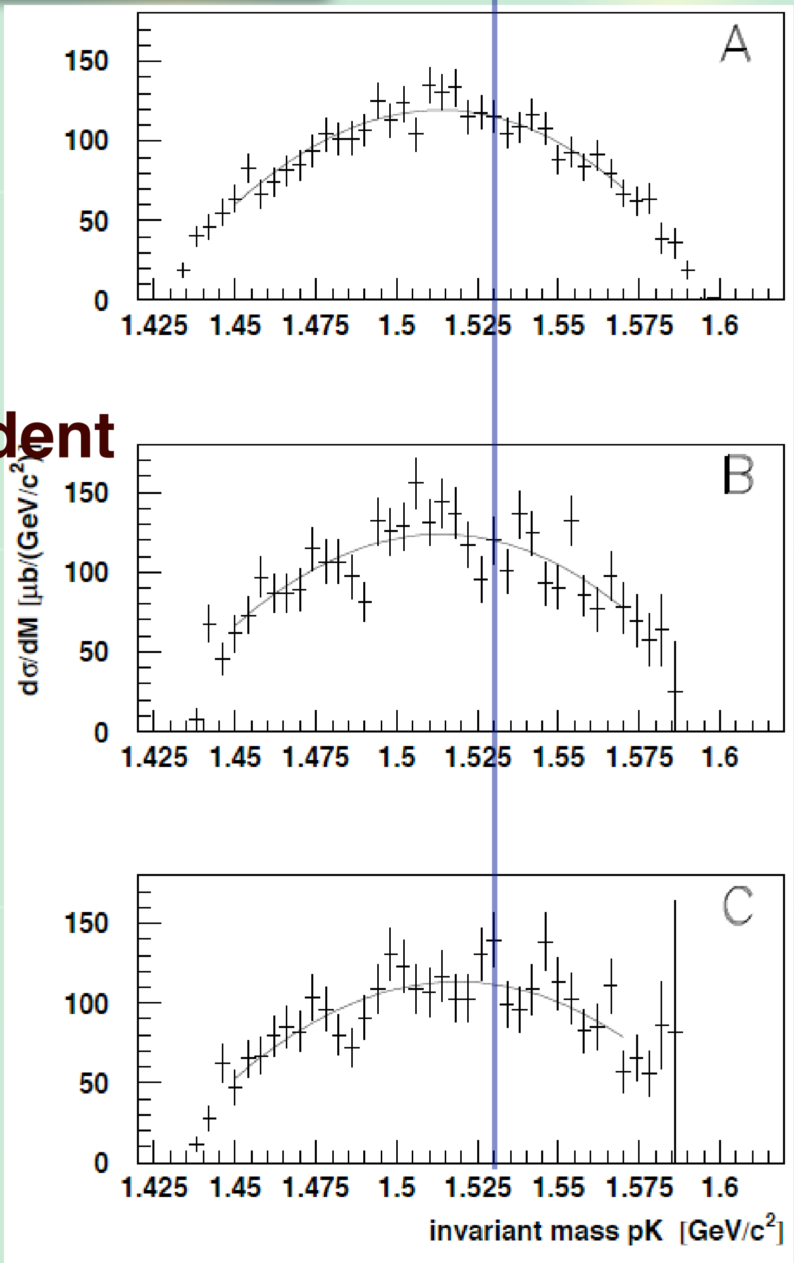
Status of pentaquark Θ⁺

COSY new (hep-ex/0612048)

$$pp \rightarrow pK^0\Sigma^+$$



new data
3 independent analysis



"Analysis does not confirm Θ."
cross section σ < 0.3 μb

Beam energy slightly different
"A" does not tag Σ⁺ decay
previous σ = 0.4 ± 0.1 ± 0.1 μb

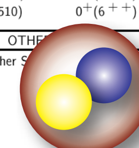
[illegible]IDATES



159 mesons

Exotic hadrons are indeed exotic !!

Motivation 1 : Exotic hadrons

Exotic hadrons : states other than $q\bar{q}$, qqq.

Experimentally, they are **exotic**.

PDG(2006) :

159 mesons  127 baryons 
1 pentaquark  with *

Theoretically, are they exotic?

--> QCD does not forbid exotic states,
effective models neither.

How exotic are they??

Motivation 2 : Chiral unitary approaches

Hadron excited states ~ 
- ○ Interaction <-- chiral symmetry
- ○ Amplitude <-- unitarity

R.H. Dalitz, and S.F. Tuan, Ann. Phys. (N.Y.) 10, 307 (1960)
J.H.W. Wyld, Phys. Rev. 155, 1649 (1967)

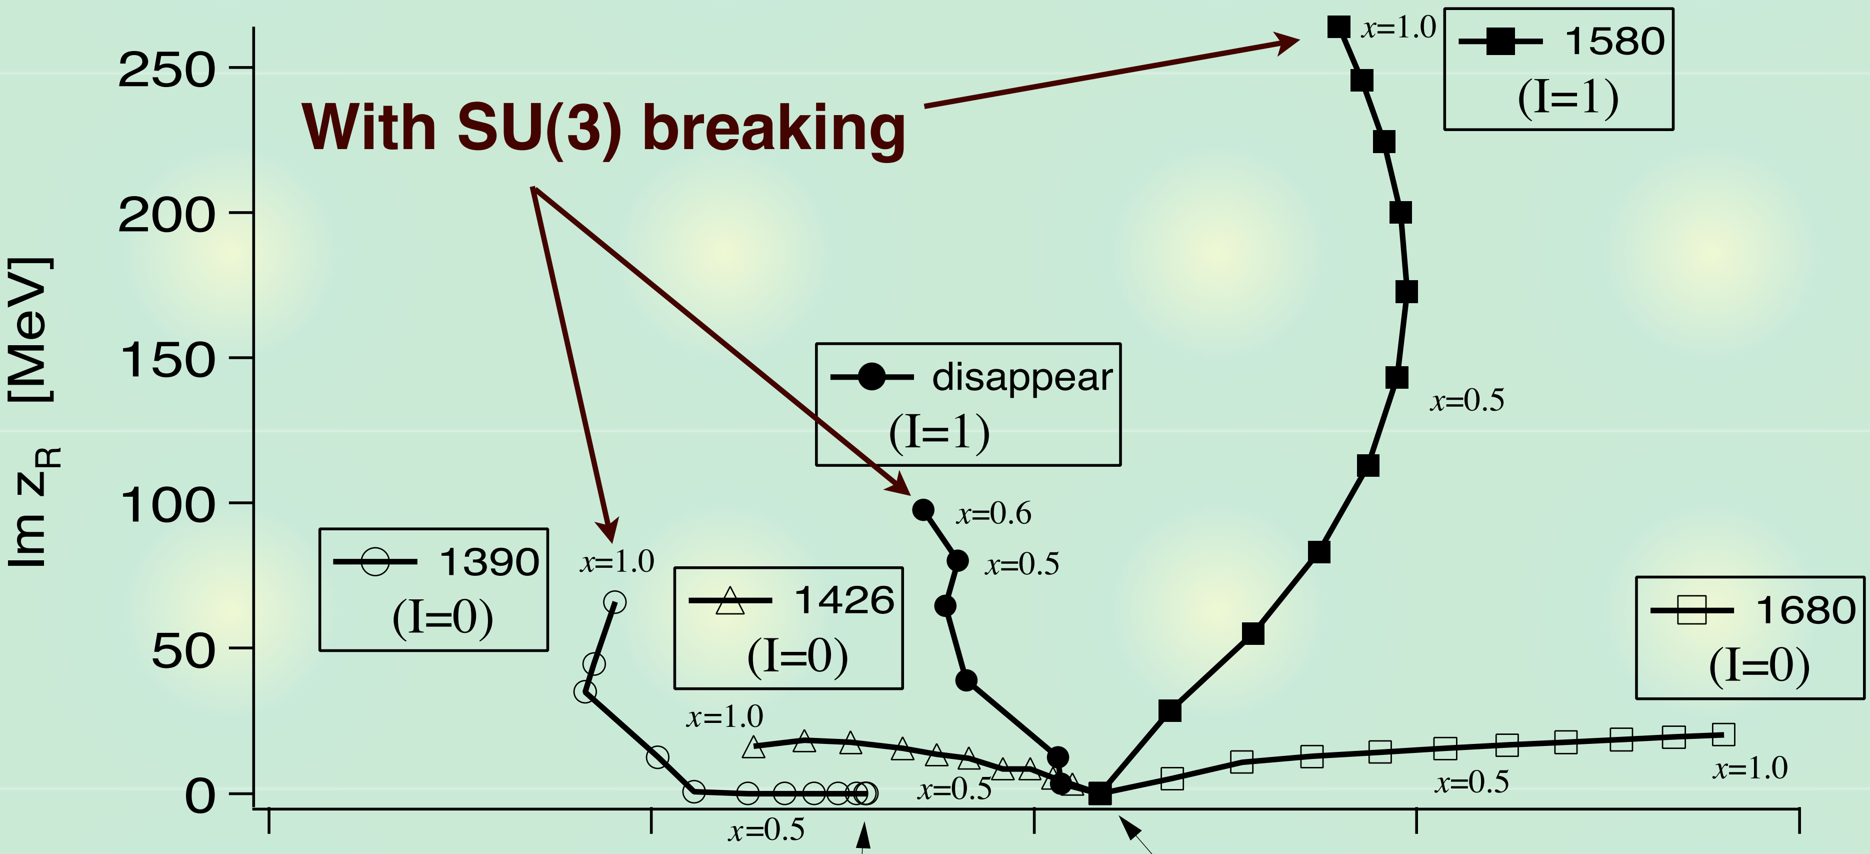
N. Kaiser, P. B. Siegel and W. Weise, Nucl. Phys. A594, 325 (1995)
E. Oset and A. Ramos, Nucl. Phys. A635, 99 (1998)
J. A. Oller and U. G. Meissner, Phys. Lett. B500, 263 (2001)
M.F.M. Lutz and E. E. Kolomeitsev, Nucl. Phys. A700, 193 (2002)

Many hadron resonances (Λ(1405), N(1535), Λ(1520), D_s(2317),...) are well described.

What about exotic hadrons?

Origin of the resonances

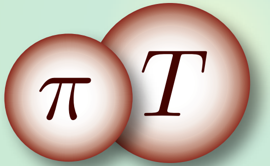
D. Jido, *et al.*, Nucl. Phys. A 723, 205 (2003)



--> Search for bound states in SU(3) symmetric limit.

Outline

Hadron-NG boson bound state



Chiral symmetry

s-wave low energy interaction

$$V_\alpha = -\frac{\omega}{2f^2} C_{\alpha,T} \qquad C_{\text{exotic}} = 1$$

Scattering theory

Critical strength for a bound state

$$C_{\text{crit}} = \frac{2f^2}{m\left(-G(M_T + m)\right)}$$

physical values : $C_{\text{exotic}} < C_{\text{crit}}$

→ **No exotic state exists.**

Low energy s-wave interaction

Scattering of a target (T) with the pion (Ad)

α 
$$= \frac{1}{f^2}\frac{p\cdot q}{2M_T}\langle \boldsymbol{F}_T\cdot\boldsymbol{F}_{\mathrm{Ad}}\rangle_\alpha + \mathcal{O}\left((m/M_T)^2\right)$$

In s-wave,

$$V_\alpha = -\frac{\omega}{2f^2}C_{\alpha,T}$$

- ○ proportional to pion energy
- ○ pion decay constant (No LEC)

Y. Tomozawa, Nuovo Cim. 46A, 707 (1966)
S. Weinberg, Phys. Rev. Lett. 17, 616 (1966)

$$C_{\alpha,T} \equiv -\langle 2\boldsymbol{F}_T\cdot\boldsymbol{F}_{\mathrm{Ad}}\rangle_\alpha = C_2(T) - C_2(\alpha) + 3 \quad (\text{for } N_f = 3)$$

Coupling strengths : Examples

Examples of Cα : (positive is attractive)

$$C_{\alpha,T} = C_2(T) - C_2(\alpha) + 3$$

α	**1**	**8**	**10**	**$\overline{10}$**	**27**	**35**
T=8 (N,Λ,Σ,Ξ)	6	3	0	0	-2	
T=10(Δ,Σ*,Ξ*,Ω)		6	3		1	-3

α	**$\bar{3}$**	**6**	**$\overline{15}$**	**24**
T=$\bar{3}$ (Λ_c,Ξ_c)	3	1	-1	-2
T=6 (Σ_c,Ξ_c*,Ω_c)	5	3	1	

- **Exotic channels : mostly repulsive**
- **Attractive interaction : C = 1**

Coupling strengths : General expression

$$T = [p, q] \qquad \alpha \in [p, q] \otimes [1, 1]$$

α	$C_{\alpha,T}$	sign
$[p+1, q+1]$	$-p-q$	repulsive
$[p+2, q-1]$	$1-p$	
$[p-1, q+2]$	$1-q$	
$[p, q]$	3	attractive
$[p, q]$	3	attractive
$[p+1, q-2]$	$3+q$	attractive
$[p-2, q+1]$	$3+p$	attractive
$[p-1, q-1]$	$4+p+q$	attractive

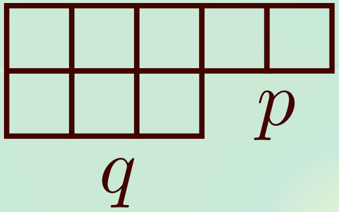
- C should be integer.
- Sign is determined for most cases.

Exoticness

Exoticness : minimal number of extra $\bar{q}q$.

For $[p, q]$ and baryon number B,

$$E = \epsilon\theta(\epsilon) + \nu\theta(\nu)$$

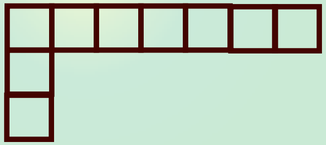


$$\epsilon \equiv \frac{p+2q}{3} - B, \qquad \nu \equiv \frac{p-q}{3} - B$$

V. Kopeliovich, Phys. Lett. B259, 234 (1991)
D. Diakonov and V. Petrov, Phys. Rev. D 69, 056002 (2004)

but... $[p, q] = [6, 0] = \mathbf{28}, \quad B = 1$

$E = 2, \quad \epsilon = 1$



uuu u$\bar{d}$ u$\bar{d}$

E. Jenkins and A.V. Manohar, Phys. Rev. Lett. 93, 022001 (2004)

but... $[p, q] = [0, 0] = \mathbf{1}, \quad B = 1$

$E = 0, \quad \epsilon = -1, \quad \nu = -1$

uds

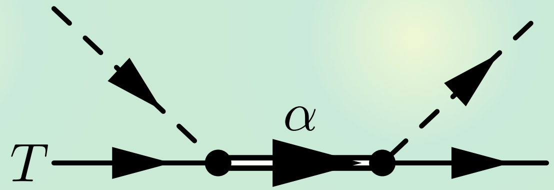
Exotic channels

Consider α is more "exotic" than T

For $[p, q]$ and baryon number B,

$$E = \epsilon\theta(\epsilon) + \nu\theta(\nu) \qquad \epsilon \equiv \frac{p+2q}{3} - B, \quad \nu \equiv \frac{p-q}{3} - B$$

$\Delta E = E_\alpha - E_T = +1$ is realized when



- $\Delta\epsilon = 1,\ \Delta\nu = 0,\ \epsilon_T \geq 0,$
  $\alpha = [p+1, q+1] : C_{\alpha,T} = -p-q$ **repulsive**
- $\Delta\epsilon = 0,\ \Delta\nu = 1,\ \nu_T \geq 0,$
  $\alpha = [p+2, q-1] : C_{\alpha,T} = 1-p$
  attraction : $p = 0$ then $\nu_T \geq 0 \to B \leq -q/3$ **not considered here**
- $\Delta\epsilon = 1,\ \Delta\nu = -1,\ \nu_T \leq 0,$
  $\alpha = [p-1, q+2] : C_{\alpha,T} = 1-q$
  attraction : $q = 0$ then $\nu_T \leq 0 \to B \geq p/3$ **OK!**

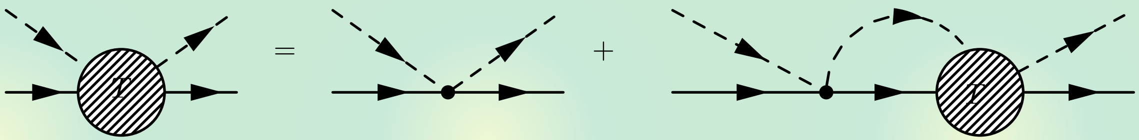
Universal attraction for more "exotic" channel

$$C_{\text{exotic}} = 1 \quad \text{for} \quad T = [p, 0], \quad \alpha = [p-1, 2]$$

Renormalization and bound states

Solve the scattering problem with $V_\alpha = -\frac{\omega}{2f^2} C_{\alpha,T}$

$$T = \frac{1}{1 - VG} V$$



Unitarity : OK

Renormalization parameter : condition

$$G(\mu) = 0, \quad \Leftrightarrow \quad T(\mu) = V(\mu) \quad \text{at} \quad \mu = M_T$$

K. Igi, and K. Hikasa, Phys. Rev. D59, 034005 (1999)

M.F.M. Lutz, and E. Kolomeitsev, Nucl. Phys. A700, 193-308 (2002)

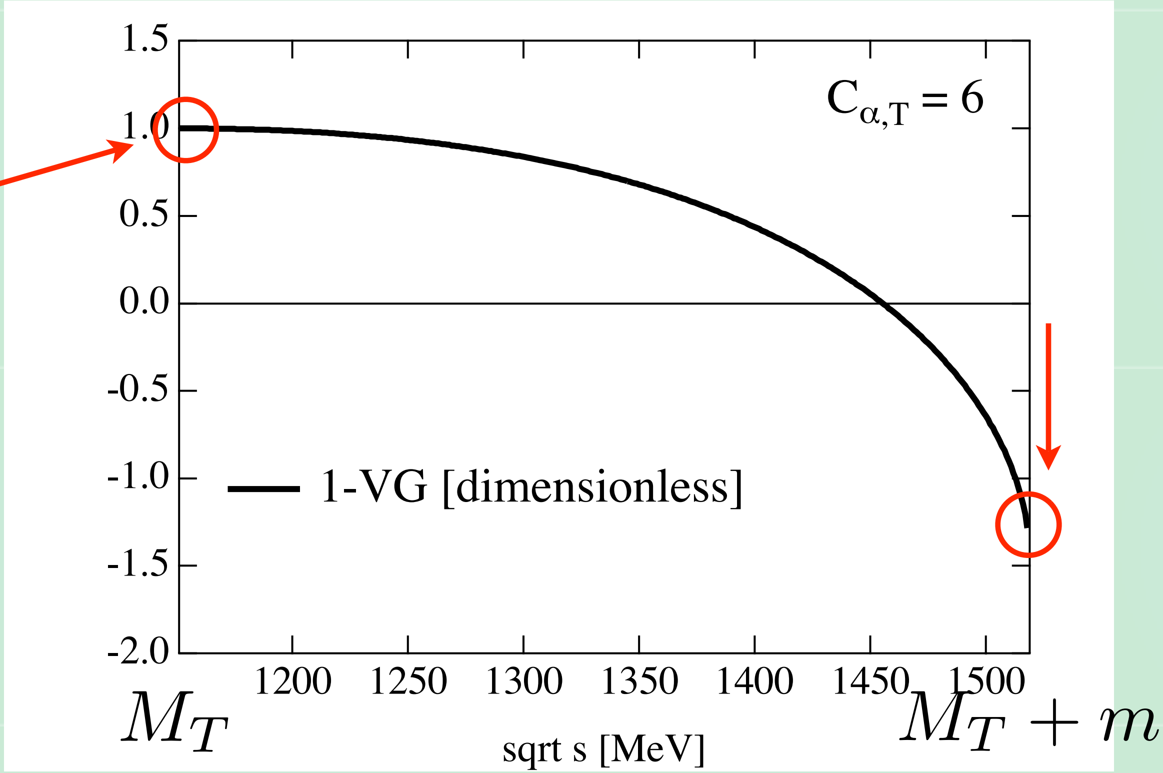
Matching with the u-channel amplitude : OK

Bound state:

$$1 - V(M_b)G(M_b) = 0 \qquad M_T < M_b < M_T + m$$

Critical attraction

$1 - V(\sqrt{s})G(\sqrt{s})$ **: monotonically decreasing.**



Fixed

$$G(M_T) = 0$$

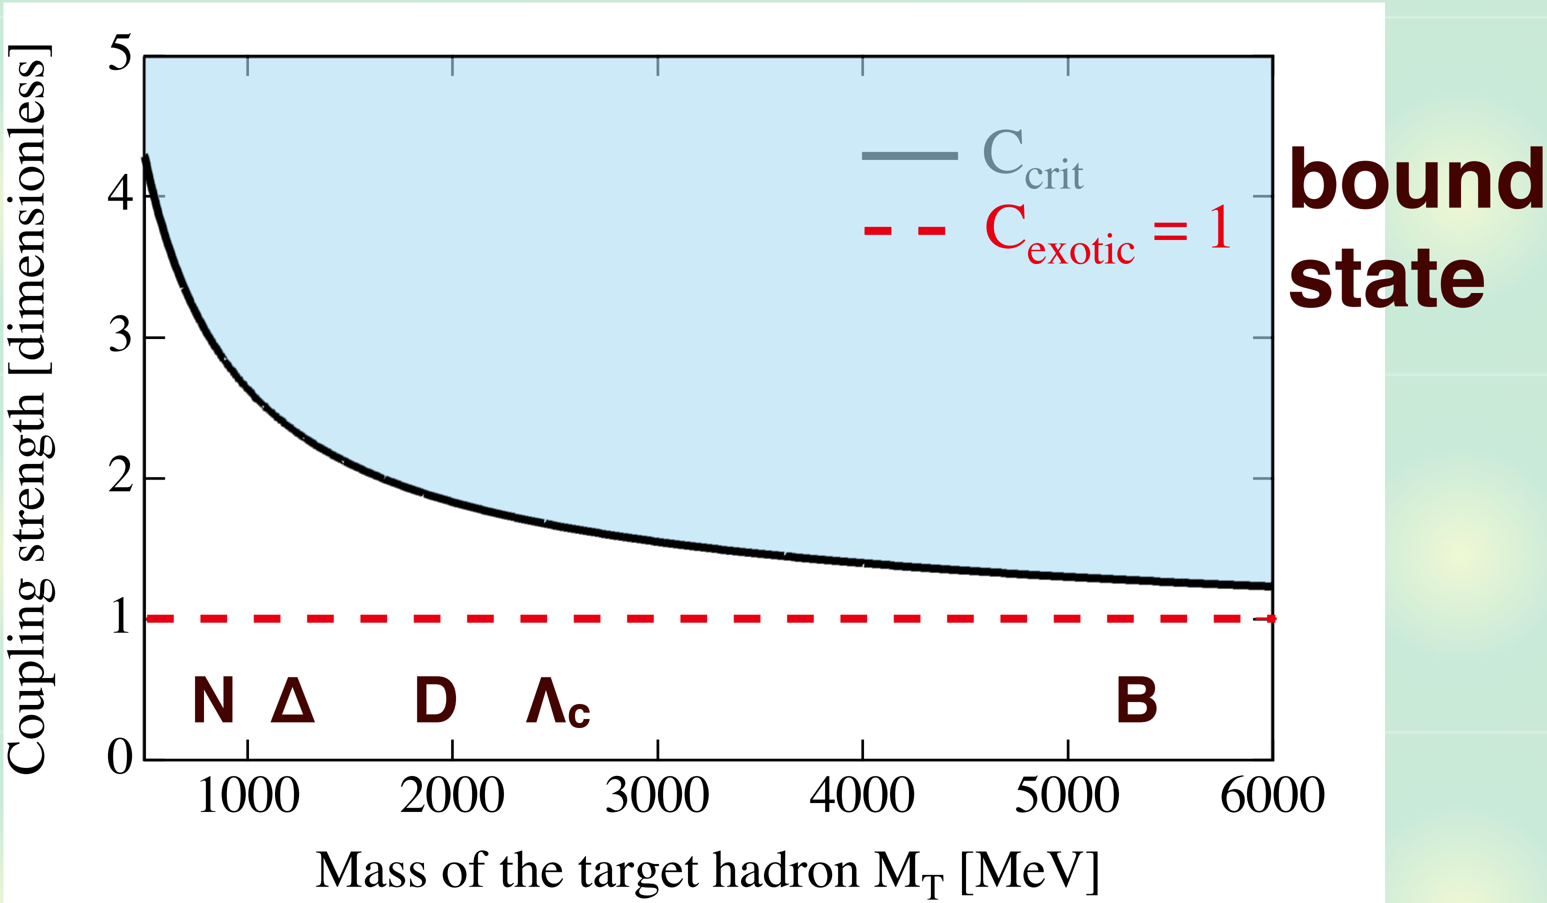
$$1 - VG = 1$$

Critical attraction : $1 - VG = 0$ at $\sqrt{s} = M_T + m$

$$C_{\text{crit}} = \frac{2f^2}{m(-G(M_T + m))}$$

Critical attraction and exotic channel

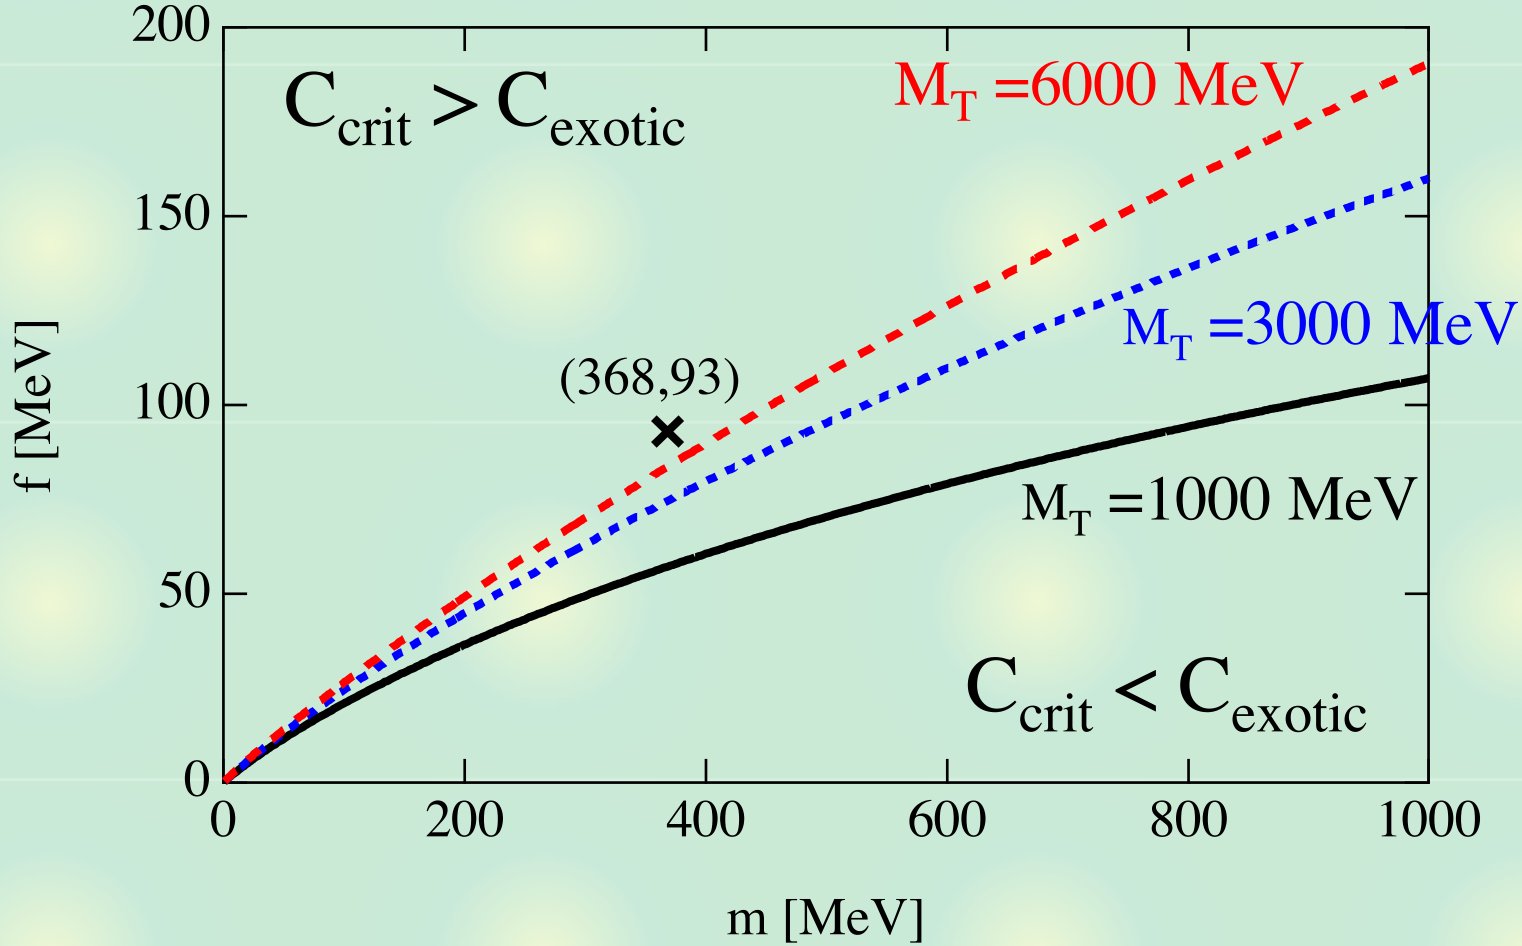
$$m = 368 \text{ MeV and } f = 93 \text{ MeV}$$



Strength is not enough.

Discussion : Dependence on the parameters

Lines for C_{crit} = 1 in (m, f) plane



- ○ C_{crit} becomes smaller for M_T↗, m↗ and f↘.
- ○ difficult to generate a bound state.

Coupling strengths in large Nc limit

In large Nc limit

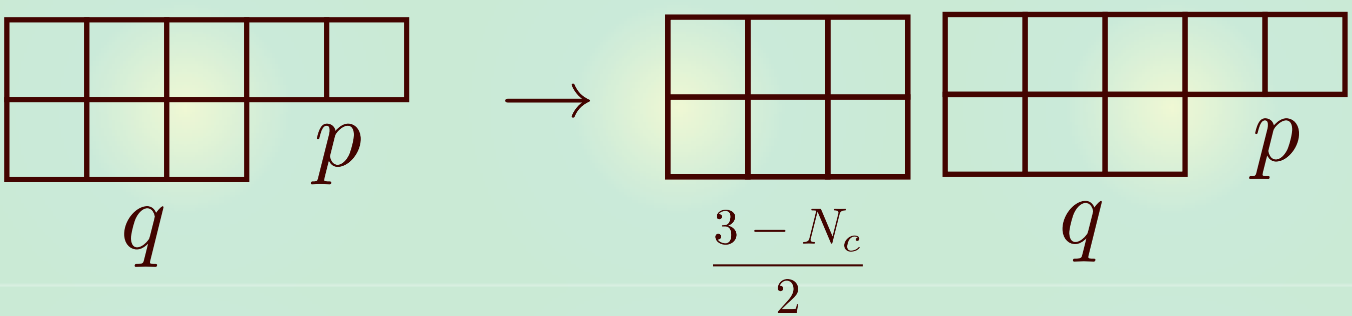
c.f. T.D. Cohen and R.F. Lebed
Phys. Rev. D74, 056006 (2006)
Praszalowicz, Talk at YKIS

$$V_\alpha = -\frac{\omega}{2f^2} C_{\alpha,T} \sim \frac{1}{N_c} \times C_{\alpha,T}$$

Flavor representation

$$C_2(T) - C_2(\alpha) + 3$$

$$[p,q] \to [p, q + \frac{3-N_c}{2}]$$



$$C([p, q + \frac{3-N_c}{2}]) = \frac{1}{3}\left(-\frac{9}{4} + p^2 + \frac{3q}{2} + pq + q^2\right) + \frac{1}{3}\left(p + \frac{q}{2}\right) N_c + \frac{N_c^2}{12}$$

Non-trivial Nc dependence

Coupling strengths in large Nc limit

Cα with arbitrary Nc : (positive is attractive)

α	"1"	"8"	"10"	"$\overline{10}$"	"27"	"35"
T="8"	$\frac{9}{2}+\frac{N_c}{2}$	3	0	$\frac{3}{2}-\frac{N_c}{2}$	$-\frac{1}{2}-\frac{N_c}{2}$	
T="10"	[illegible]	[illegible]	3		$\frac{5}{2}-\frac{N_c}{2}$	$-\frac{1}{2}-\frac{N_c}{2}$

Λ(1405) two-pole?

α	"$\bar{3}$"	"6"	"$\overline{15}$"	"24"
T="$\bar{3}$"	3	1	$-\frac{N_c}{3}$	
T="6"	5	3	$\frac{5}{2}-\frac{N_c}{2}$	$\frac{1}{2}-\frac{5N_c}{6}$

Exotic attractions --> repulsions

Discussion 1 : large Nc behavior

For arbitrary Nc, $[p,q] \to \left[p, q+\frac{3-N_c}{2}\right]$ $V \propto -\frac{1}{f^2}C \sim \frac{1}{N_c}C(N_c)$

α	$C_{``\alpha", ``T"}(N_c)$	$V(N_c \to \infty)$	ΔE
$[p+1, q+1]$	$(3-N_c)/2-p-q$	**repulsive**	1 or 0
$[p+2, q-1]$	$1-p$	0	1 or 0
$[p-1, q+2]$	$(5-N_c)/2-q$	**repulsive**	1 or 0
$[p, q]$	3	0	0
$[p, q]$	3	0	0
$[p+1, q-2]$	$(3+N_c)/2+q$	**attractive**	0 or -1
$[p-2, q+1]$	$3+p$	0	0 or -1
$[p-1, q-1]$	$(5+N_c)/2+p+q$	**attractive**	0 or -1

- **Exotic attraction --> repulsion**
- **No attraction in exotic channels.**

Summary 1 : SU(3) limit

We study the exotic bound states in s-wave chiral dynamics in flavor SU(3) limit.

- The interaction in exotic channels are in most cases repulsive.
- There are attractions in exotic channels, with universal and the smallest strength : $C_{\text{exotic}} = 1$
- This is not enough to generate a bound state : $C_{\text{exotic}} < C_{\text{crit}}$
- No attractive interaction exists in exotic channels in the large Nc limit.

Summary 2 : Physical world

Caution!

- The exotic hadrons here are the s-wave meson-hadron molecule states ($1/2^-$ for Θ^+).
- We do not exclude the exotics which have other origins (genuine quark state, soliton rotation,...)
- In practice, SU(3) breaking effect, higher order terms,...

It is difficult to generate exotic hadrons as in the same way with Λ(1405), Λ(1520),... based on chiral dynamics.
