We report a physical background of the wave function prediction in the infinite system density matrix renormalization group (DMRG) method,^{1)–4)} from the view point of two-dimensional vertex model,⁵⁾ a typical lattice model in statistical mechanics. Singular value decomposition applied to rectangular corner transfer matrices naturally draws matrix product representation for the maximal eigenvector of the row-to-row transfer matrix. The wave function prediction can be expressed as the insertion of an approximate half-column transfer matrix. This insertion process is in accordance with the scheme proposed by McCulloch.¹⁾
