

# Gravitational wave background anisotropies as a probe of the early universe

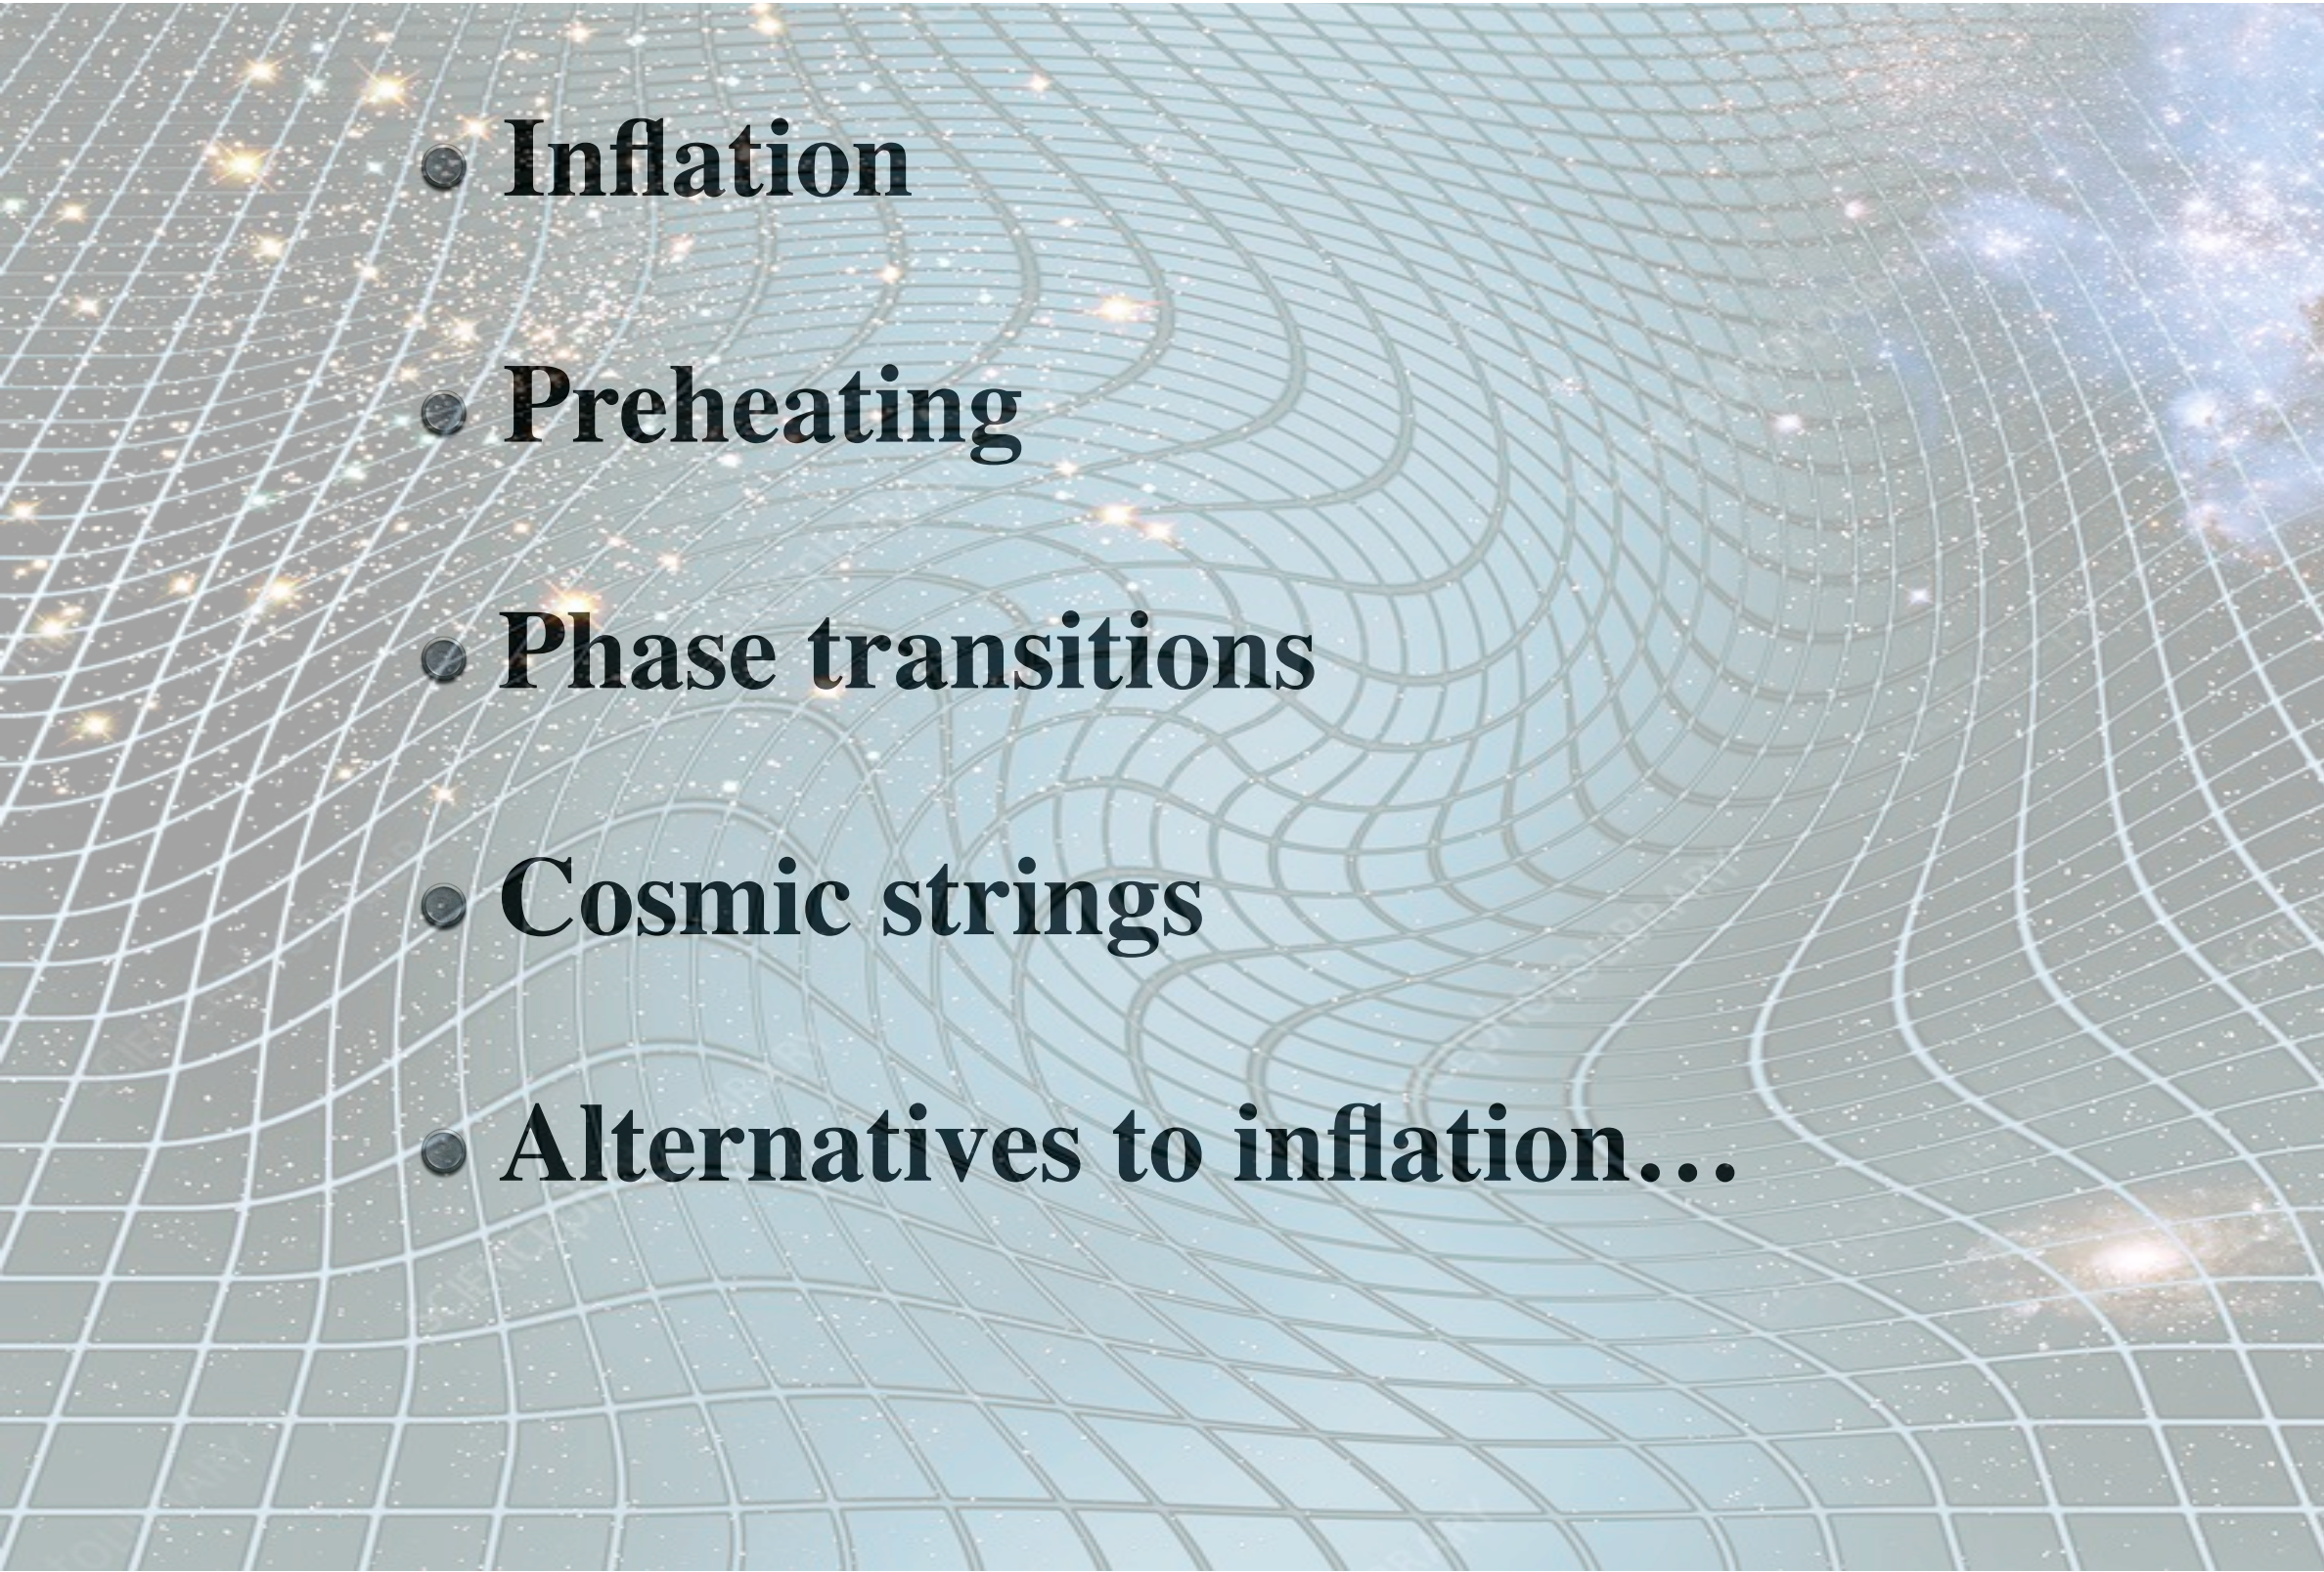

**Ema Dimastrogiovanni**

*The University of Groningen*

**Gravity and Cosmology 2024 - YITP - February 2nd 2024**

# GW background from the early universe

- **Inflation**
  - **Preheating**
  - **Phase transitions**
  - **Cosmic strings**
  - **Alternatives to inflation...**
- 

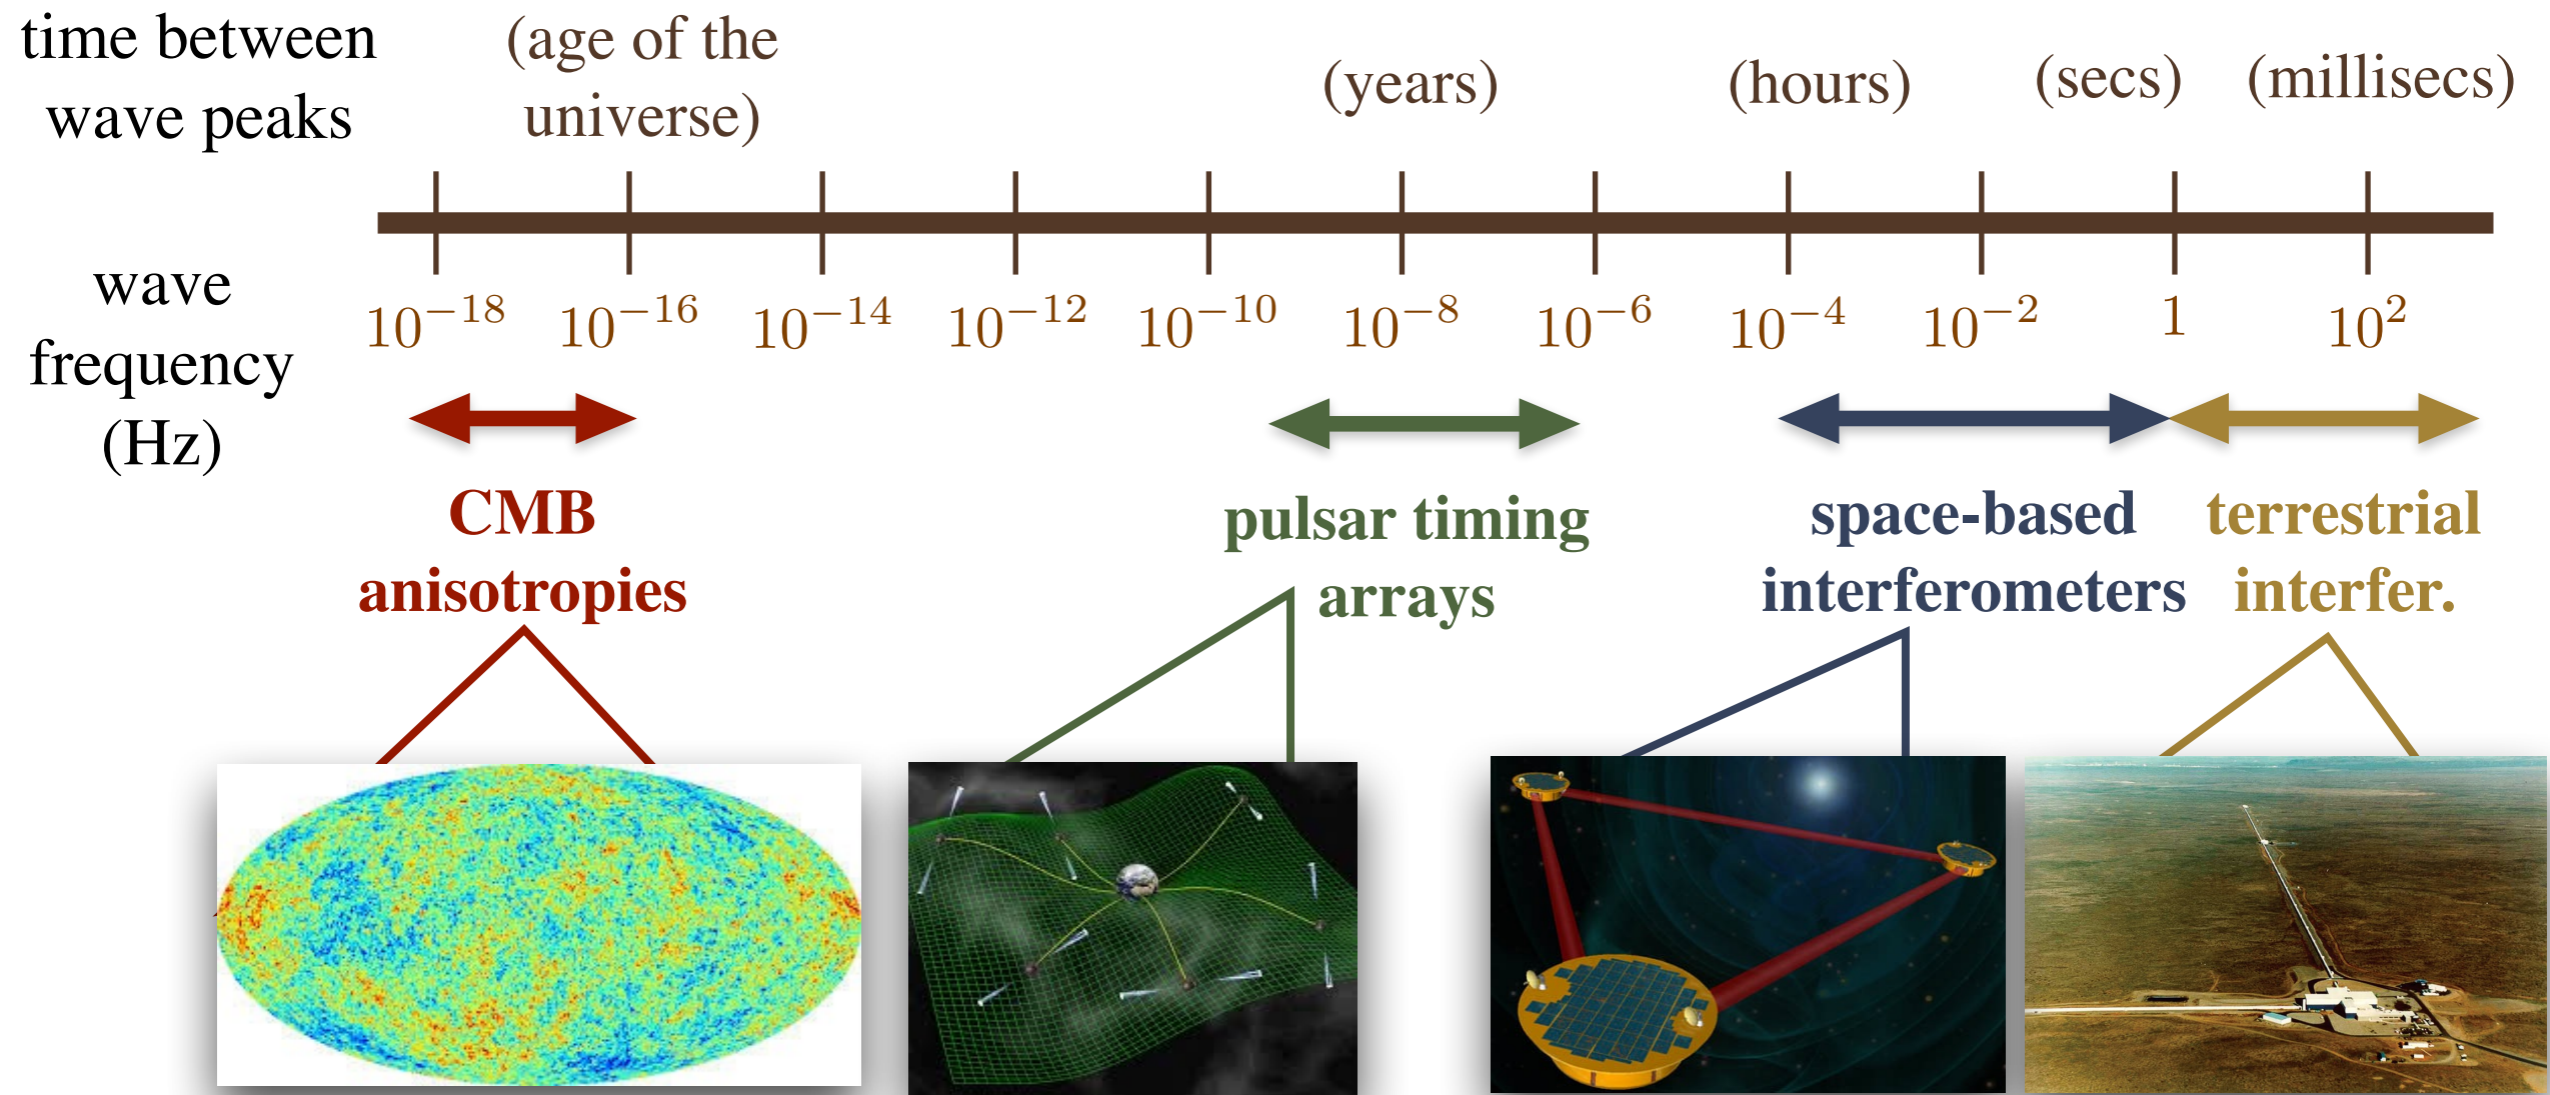

# Multiple potential GW production mechanisms within inflation alone:

- GW from the amplification of vacuum fluctuations
- Generation of GW from additional fields during inflation
- GW generated at second order from scalar fluctuations

# Scales — Experiments

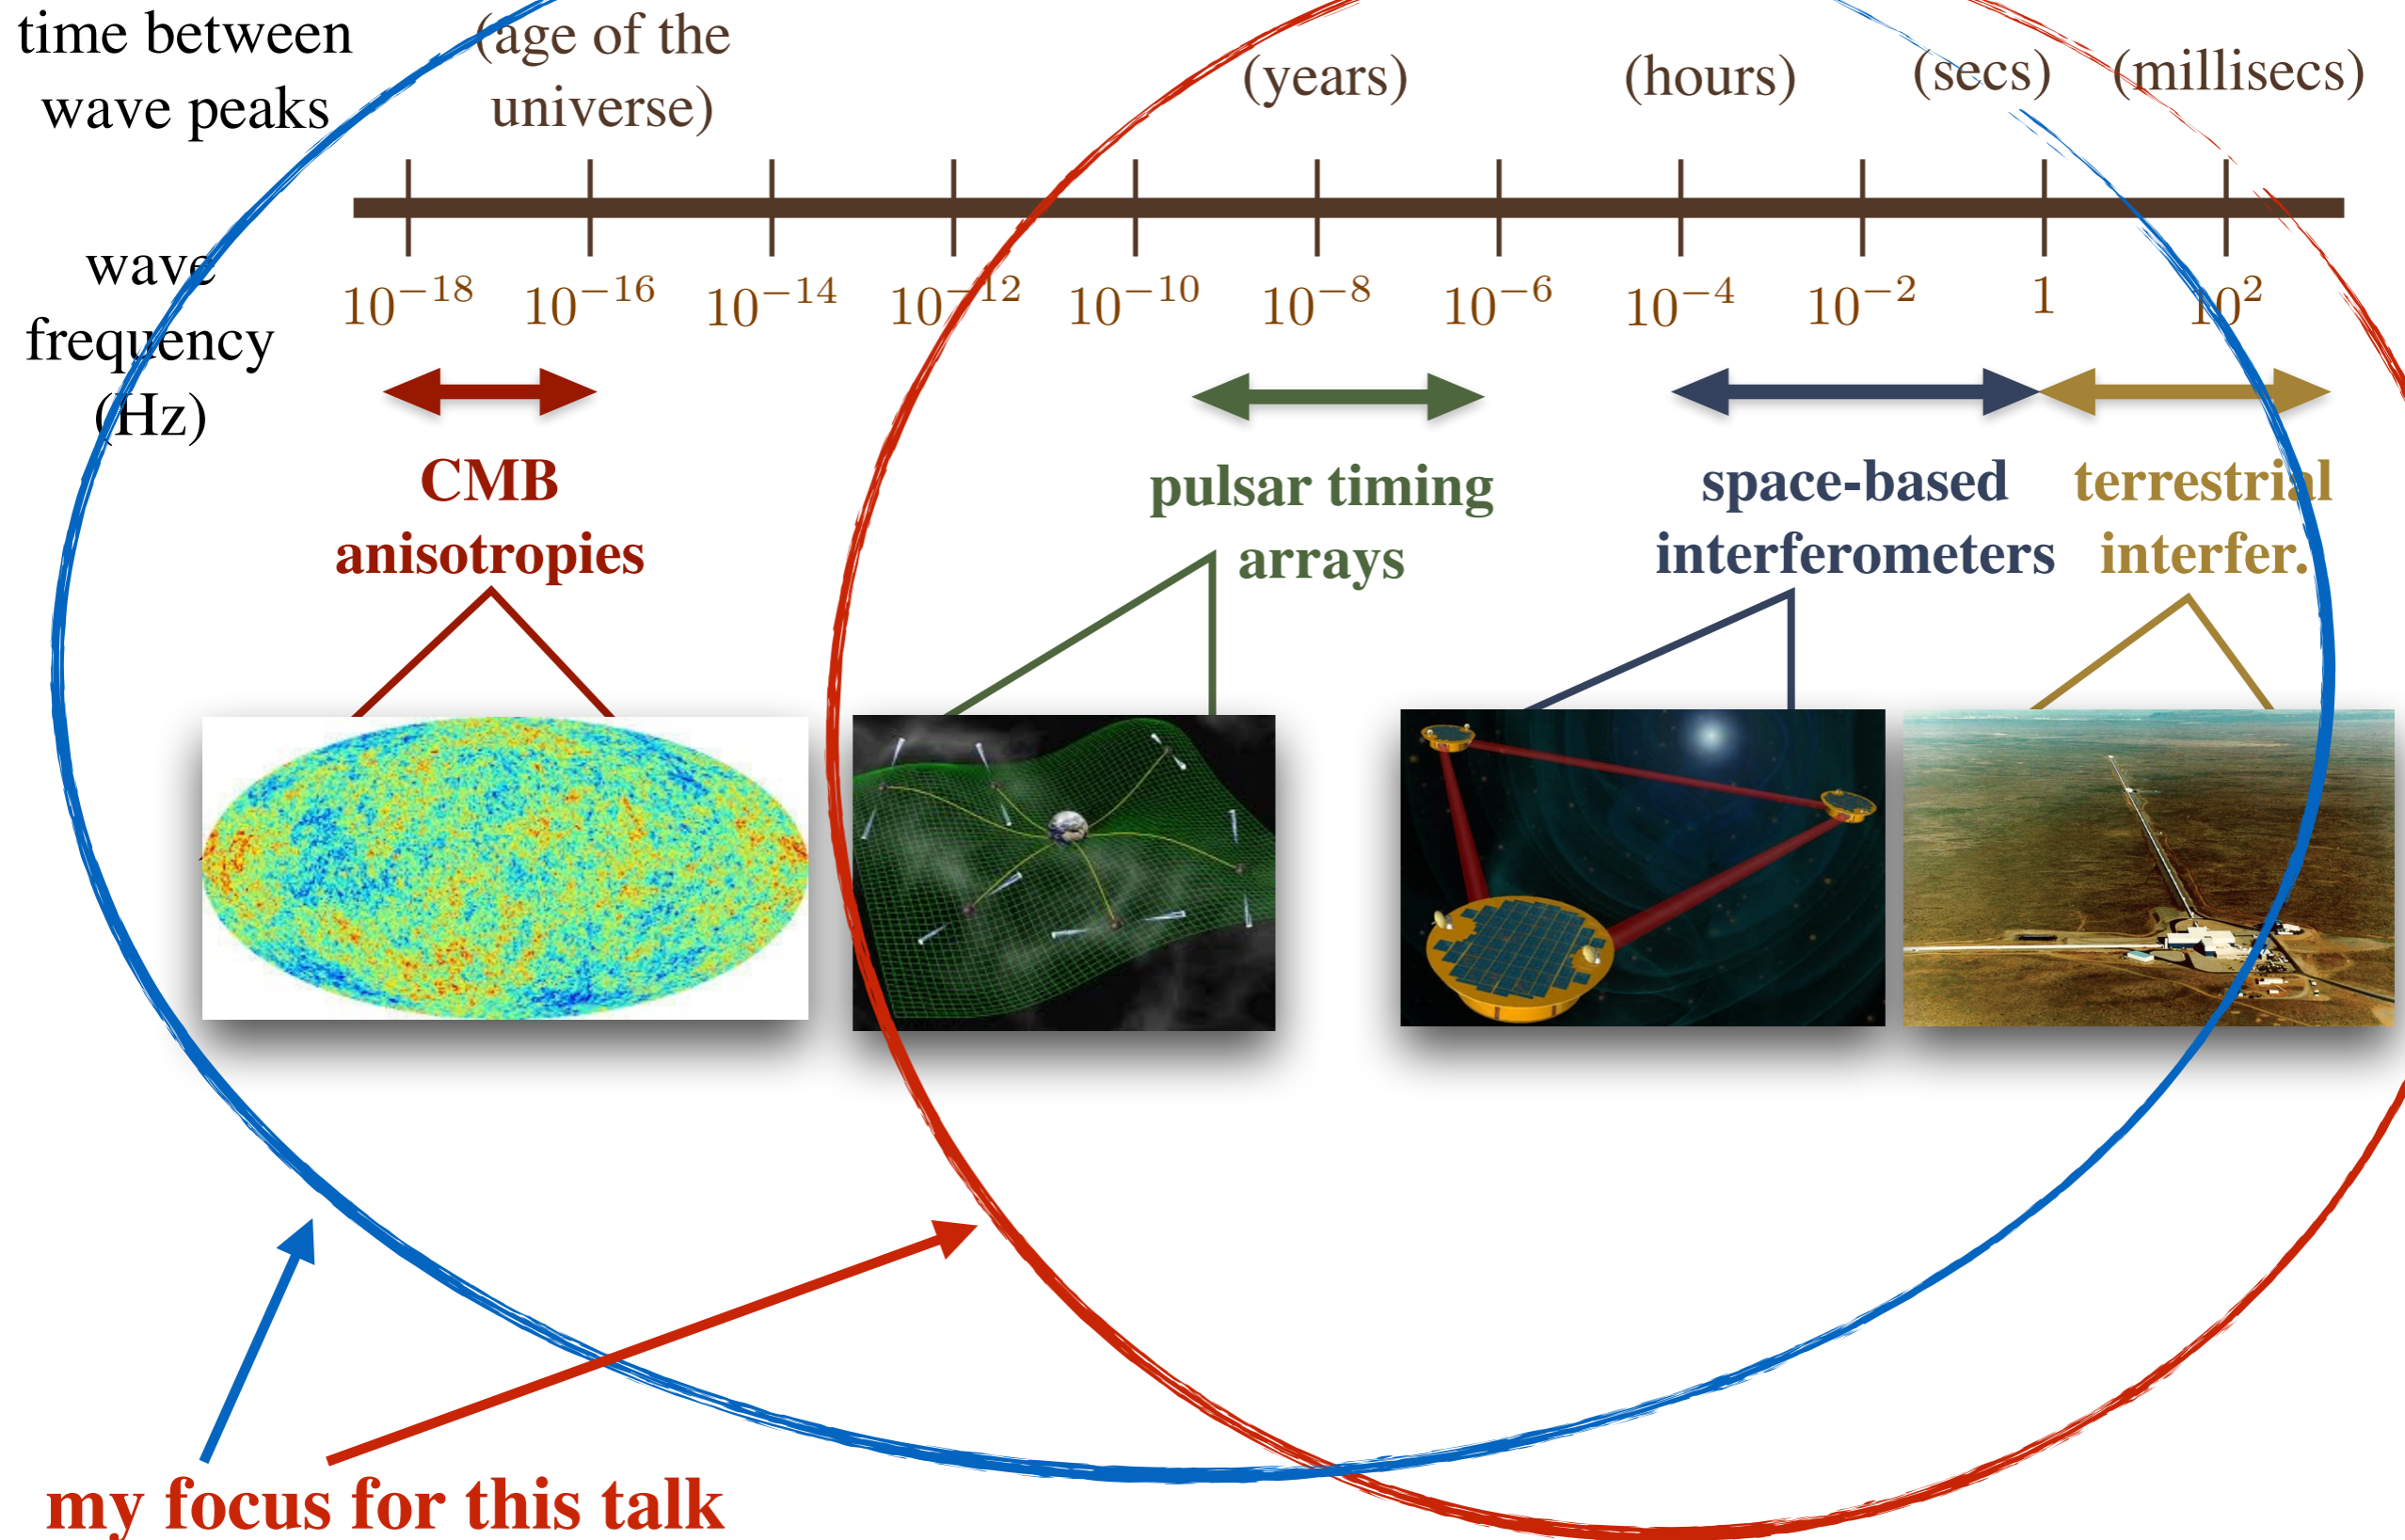

# Scales — Experiments

**my focus for this talk**

# Scales – Experiments

# There is more: astrophysical background

expected from the superposition of signals from mergers  
(black holes, neutron stars)

# A puzzle to unravel ...

Already the case for the observed gravitational wave background by PTA!

- How does it look like?
- What info does it provide on inflation?
- How do we **characterise** it (and distinguish it from other GWB)?

- Frequency profile
- Chirality
- **Non-Gaussianity**
- **Anisotropies**

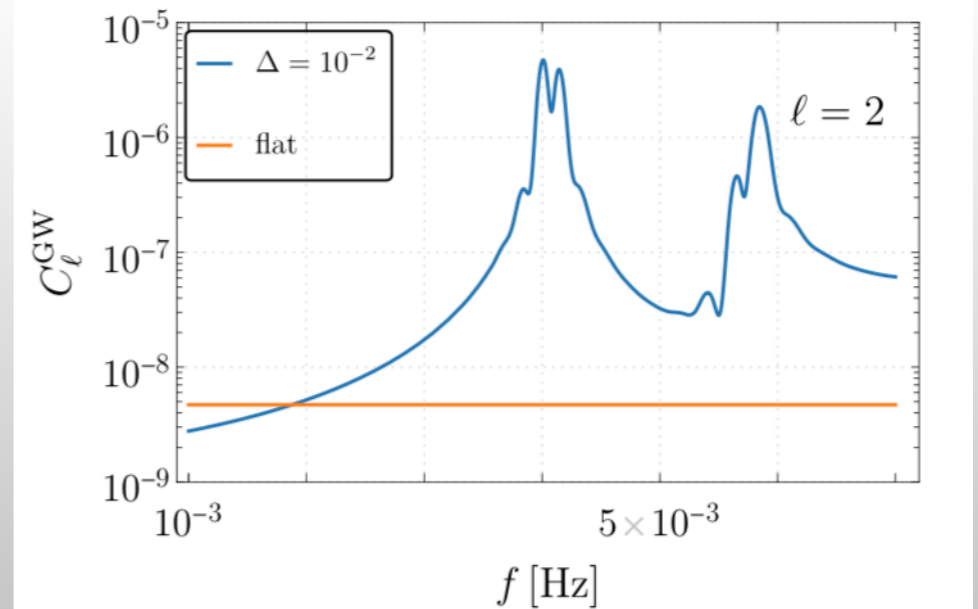

# Outline

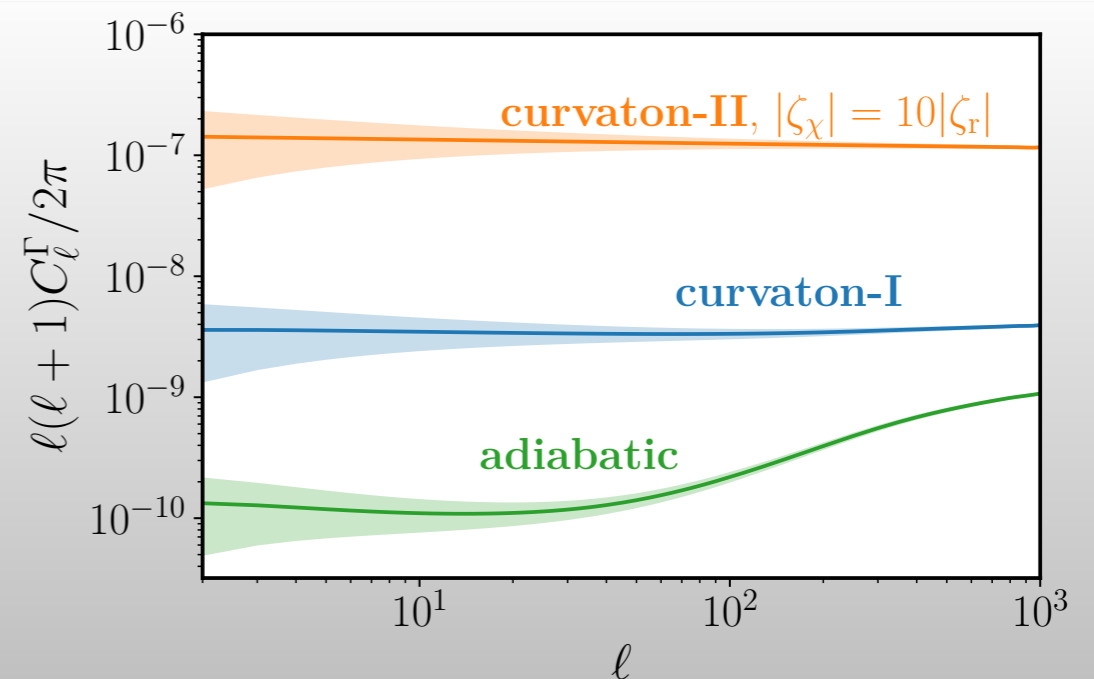

- Anisotropies as a probe of **squeezed non-Gaussianity** (part I)

- Anisotropies as a probe of **primordial black holes** physics (part II)

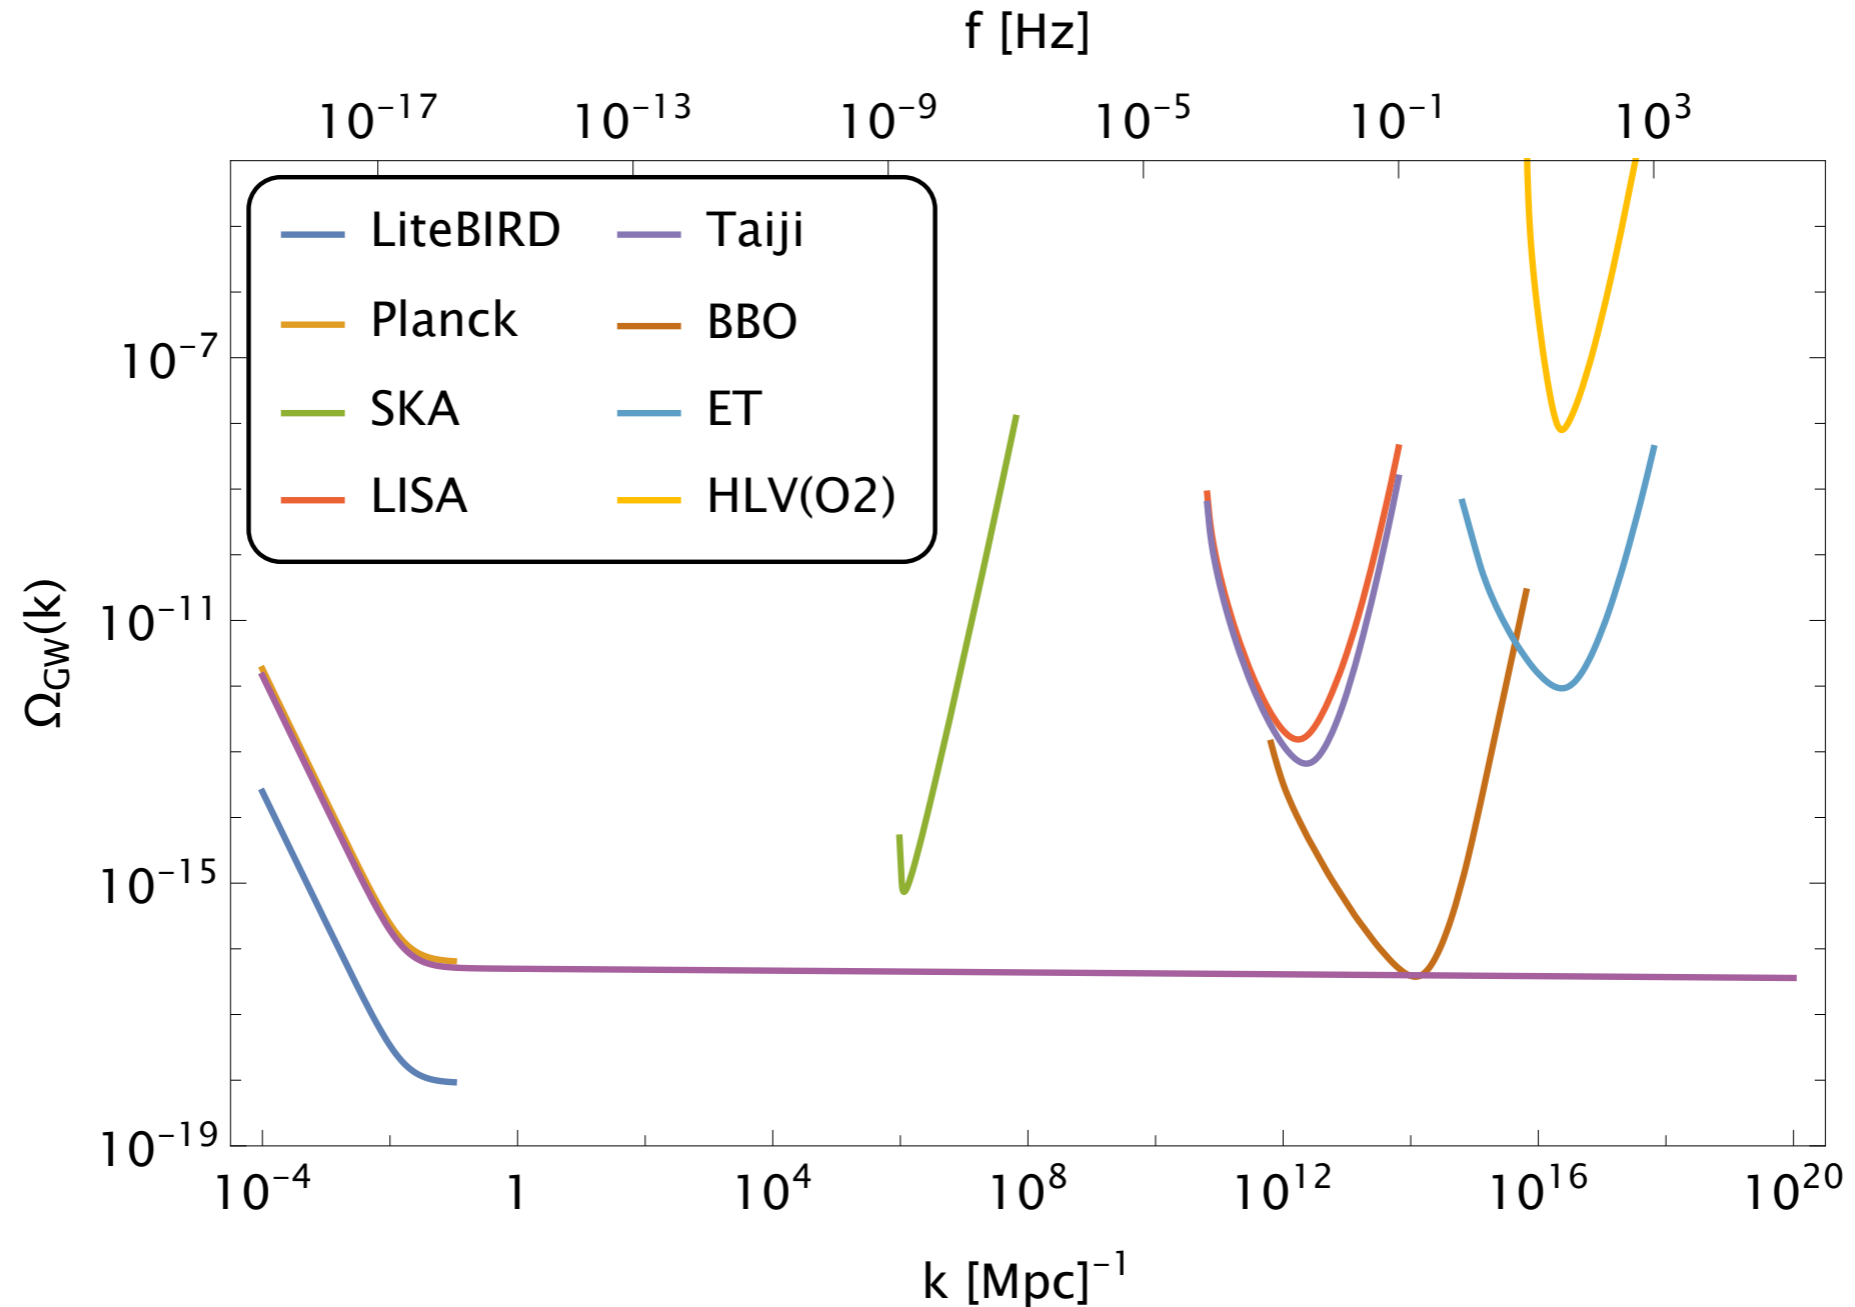

- Anisotropies as a probe of **isocurvature perturbations** (part III)

# Anisotropies in the stochastic GW background

Next step: angular information:

looking for spatial variations in the contributions to the energy density spectrum

# Anisotropies in the stochastic GW background

$$\Omega_{\text{GW}}(k) = \bar{\Omega}_{\text{GW}}(k) \left[ 1 + \frac{1}{4\pi} \int d^2 \hat{n} \delta_{\text{GW}}(k, \hat{n}) \right]$$

energy density spectrum  
for the GW background

isotropic  
component

directional intensity flux  
("anisotropy")

analogous to  $\frac{\Delta T}{T}$   
for CMB anisotropies

$k$  = comoving wavenumber  
( $\sim$  observed frequency)

**Angular power spectrum** for the anisotropies:

$$\delta_{\text{GW}}(k, \hat{n}) = \sum_{\ell m} \delta_{\ell m}^{\text{GW}} Y_{\ell m}(\hat{n})$$

$$\langle \delta_{\ell m}^{\text{GW}} \delta_{\ell m}^{\text{GW}*} \rangle \equiv \delta_{\ell \ell'} \delta_{m m'} C_{\ell}^{\text{GW}}$$

# Origin of the anisotropies

From propagation through  
the perturbed universe

Intrinsic to the  
production mechanism

# Origin of the anisotropies: propagation through inhomogeneities

GW propagate through the perturbed universe

subject to Sachs-Wolfe / integrated Sachs-Wolfe ...,  
similarly to CMB photons

# Origin of the anisotropies: propagation through inhomogeneities

- Gravitational redshift:

Hierarchy of scales between GW frequency and scale of the perturbations  
 GW background = collection of massless particles emitted at early times

$$ds^2 = a^2(\eta) \left[ -d\eta^2 + (1 + 2\zeta)\delta_{ij}dx^i dx^j - \frac{4}{5aH} \partial_i \zeta d\eta dx^i \right] \quad (\text{uniform density gauge in matter domination})$$

Geodesic equation for the graviton

graviton's 4-momentum:  $P^\mu = \frac{dx^\mu}{d\lambda}$

$$\frac{d^2 x^\mu}{d\lambda^2} + \Gamma_{\alpha\beta}^\mu \frac{dx^\alpha}{d\lambda} \frac{dx^\beta}{d\lambda} = 0$$

affine parameter along the graviton's geodesic

$$P_0(\eta) = P_0(\eta_i) \left[ 1 + \frac{1}{5} (\zeta(\eta, \mathbf{x}) - \zeta(\eta_i, \mathbf{x}_i)) \right]$$

value at observer's location  
 (common to emissions from all directions) -> it drops out

value at "emission"  
 (direction dependent)

# Origin of the anisotropies: propagation through inhomogeneities

Large-scales: SW dominates

$$\frac{\delta f(\hat{n})}{f} \propto [\zeta_L(\text{today}) - \zeta_L(\hat{n} \cdot \eta_0)]$$

$$\zeta_L(\hat{n}_1 \cdot \eta_0) \neq \zeta_L(\hat{n}_2 \cdot \eta_0)$$

Direction-dependent frequency shift

Anisotropy in the GW energy density

$$\delta_{\text{GW}} \sim \left( \frac{\partial \ln \Omega_{\text{GW}}}{\partial \ln k} \right) \zeta_L$$

$$\delta_{\text{GW}} \simeq \mathcal{O}(1) \zeta_L \simeq 10^{-5} \quad (\text{for SFSR Inflation})$$

# Origin of the anisotropies: original calculation (adiabatic perturbations)

Hierarchy of scales between GW frequency and scale of the perturbations  
 GW background = collection of massless particles emitted at early times

$$ds^2 = a^2(\eta) \left[ -d\eta^2 + (1 + 2\zeta)\delta_{ij}dx^i dx^j - \frac{4}{5aH}\partial_i\zeta d\eta dx^i \right] \quad (\text{uniform density gauge in matter domination})$$

## ● Field theory derivation:

Massless scalar field  $h$  in a perturbed universe:

$$S = \frac{1}{2} \int d^3x d\eta a^2 (1 + 3\zeta) \left[ (-\partial_\eta h)^2 + (1 - 2\zeta) (\vec{\partial}h)^2 - \frac{4(\partial_\eta h)}{5aH} \vec{\partial}\zeta \cdot \vec{\partial}h \right]$$

$$\mathcal{L}_{\text{int}} \propto a^2 \zeta \left[ 3 (\partial_\eta h)^2 - (\vec{\partial}h)^2 \right] + \frac{4a(\partial_\eta h)}{5H} \vec{\partial}\zeta \cdot \vec{\partial}h$$

correction to the two point function of  $h$  proportional to  $\zeta$

# Origin of the anisotropies: Boltzmann formalism

Hierarchy of scales between GW frequency and scale of the perturbations

GW background = collection of massless particles emitted at early times  
and described by a distribution function  $f(x^\mu, p^\mu)$

$$ds^2 = a^2(\eta) [-(1 + 2\Phi)d\eta^2 + (1 - 2\Psi)\delta_{ij}dx^i dx^j]$$

$$\frac{df}{d\lambda} = \underbrace{C[f(\lambda)]}_{\substack{\text{collision} \\ \text{term} \\ = 0 \\ \text{[gravitons} \\ \text{basically} \\ \text{decoupled} \\ \text{below } M_p]}} + \underbrace{I[f(\lambda)]}_{\substack{\text{injection} \\ \text{term} \\ = 0 \\ \text{[accounted for} \\ \text{as an initial} \\ \text{condition for } f]}} \simeq 0 \quad \rightarrow \quad \frac{df}{d\eta} = \frac{\partial f}{\partial \eta} + \frac{\partial f}{\partial x^i} \underbrace{\frac{dx^i}{d\eta}}_{n^i} + \frac{\partial f}{\partial q} \underbrace{\frac{dq}{d\eta}}_{q \left[ \frac{\partial \Psi}{\partial \eta} - \frac{\partial \Phi}{\partial x^i} n^i \right]} = 0$$

(focusing on free-streaming, SW and iSW terms)

graviton's 4-momentum:

$$p^\mu = \frac{dx^\mu}{d\lambda} \quad q \equiv |\vec{p}|a$$

[Contaldi, 2017- Bartolo et al 2019  
see also: Pitrou et al, 2020]

# Origin of the anisotropies: Boltzmann formalism

$$\frac{\partial f}{\partial \eta} + \frac{\partial f}{\partial x^i} n^i + q \frac{\partial f}{\partial q} \left[ \frac{\partial \Psi}{\partial \eta} - \frac{\partial \Phi}{\partial x^i} n^i \right] = 0$$

$$f(\eta_0, \vec{x}_0, \hat{n}, q) = \bar{f}(q) - q \frac{\partial \bar{f}}{\partial q} \Gamma(\eta_0, \vec{x}_0, \hat{n}, q)$$

(linear expansion for the distribution function)

$$\rho_{\text{GW}}(\eta_0, \vec{x}_0) = \int d^3 p p f(\eta_0, \vec{x}_0, q, \hat{n}) = \rho_{\text{cr}} \int d \ln q \Omega_{\text{GW}}(\eta_0, \vec{x}_0, q)$$

observer's  
time/location

$$\Omega_{\text{GW}}(\eta_0, \vec{x}_0, q) = \bar{\Omega}_{\text{GW}}(\eta_0, \vec{x}_0, q) \left[ 1 + \frac{1}{4\pi} \int d^2 n \delta_{\text{GW}}(\hat{n}, q) \right] \text{ (our previous definition for } \delta \text{)}$$

$$\delta_{\text{GW}}(\eta_0, \vec{x}_0, \hat{n}, q) = \left[ 4 - \frac{\partial \ln \bar{\Omega}_{\text{GW}}(\eta_0, q)}{\partial \ln q} \right] \Gamma(\eta_0, \vec{x}_0, \hat{n}, q)$$

$$\Gamma(\eta_0, \vec{x}_0, \hat{n}, q) = \Gamma(\eta_i, \vec{x}_i, q) + \Phi(\eta_i, \vec{x}_i) + \int_{\eta_i}^{\eta_0} d\eta (\Phi' + \Psi')$$

initial

SW

iSW

[Contaldi, 2017- Bartolo et al 2019  
see also: Pitrou et al, 2020]

# Origin of the anisotropies: Boltzmann formalism

$$\Gamma(\eta_0, \vec{x}_0, \hat{n}, q) = \underbrace{\Gamma(\eta_i, \vec{x}_i, q)}_{\Gamma_I} + \Phi(\eta_i, \vec{x}_i) + \int_{\eta_i}^{\eta_0} d\eta (\Phi' + \Psi')$$

For adiabatic primordial perturbations:

$$\frac{\delta\rho_i}{(1+w_i)\bar{\rho}_i} = \frac{\delta\rho_j}{(1+w_j)\bar{\rho}_j}$$

(for any two species “i” and “j”)

applying this to photons and gravitons fluids:

$$w_i = w_j = 1/3$$

$$\frac{\delta\rho_\gamma}{\bar{\rho}_\gamma} = -2\Phi \quad (\text{from Einstein equ. in RD, superhorizon})$$

$$\Gamma_I = \frac{1}{4} \frac{\delta\rho_{\text{GW}}}{\bar{\rho}_{\text{GW}}} \quad (\text{by definition})$$

↓

$$\Gamma_I = -\frac{1}{2}\Phi$$

$$\begin{aligned} \Gamma &= -\frac{1}{2}\Phi + \Phi + \int_{\eta_i}^{\eta_0} d\eta (\Phi' + \Psi') \\ &= \frac{1}{2}\Phi + \int_{\eta_i}^{\eta_0} d\eta (\Phi' + \Psi') \\ &= -\frac{1}{3}\zeta + \dots \end{aligned}$$

$\Phi = -\frac{2}{3}\zeta$

# Origin of the anisotropies: propagation through inhomogeneities

Large-scales: SW dominates

$$\frac{\delta f(\hat{n})}{f} \propto [\dots]$$

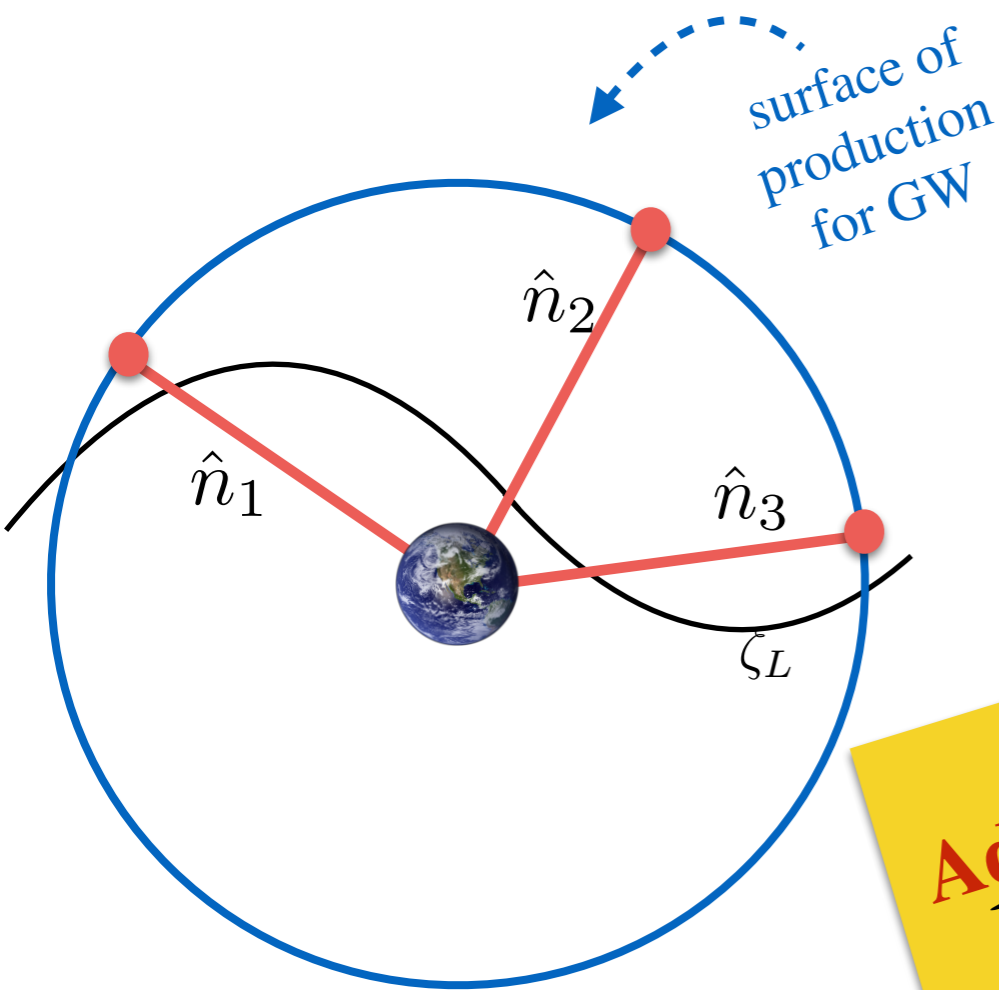

**Adiabatic primordial perturbations**  
**Small spectral tilt for tensors**  
**No intrinsic anisotropies**

Anisotropy in the energy density

$$\delta_{\text{GW}} \sim \left( \frac{\partial \ln \Omega_{\text{GW}}}{\partial \ln k} \right) \zeta_{\text{L}}$$

$\delta_{\text{GW}} \simeq \mathcal{O}(1) \zeta_{\text{L}} \simeq 10^{-5}$  (for SFSR Inflation)

# Origin of the anisotropies: propagation through inhomogeneities

# Anisotropies for peaked spectra

Anisotropies from propagation:  
amplitude proportional to the slope of the spectrum

$$\delta_{\text{GW}} \sim \left( \frac{\partial \ln \Omega_{\text{GW}}}{\partial \ln k} \right) \zeta_{\text{L}}$$

pronounced slope

enhanced anisotropies

# Anisotropies for peaked spectra

Models with sharp peaks in the scalar power spectrum (e.g. PBH production)

- a large GW background with sharp peaks induced at second order from scalar perturbations [Ananda - Clarkson - Wands 2006, Baumann et al. 2007]

$$\Omega_{\text{GW},r}(k) = 3 \int_0^\infty dv \int_{|1-v|}^{1+v} du \frac{\mathcal{T}(u,v)}{u^2 v^2} \mathcal{P}_{\mathcal{R}}(vk) \mathcal{P}_{\mathcal{R}}(uk)$$

$$\mathcal{P}_{\mathcal{R}}(k)|_{k \gg k_{\text{CMB}}} = \frac{A_{\mathcal{R}}}{\sqrt{2\pi}\Delta} \exp\left[-\frac{\ln^2(k/k_*)}{2\Delta^2}\right]$$

$\Delta$	$10^{-2}$
$f_*$	$5 \times 10^{-3} \text{ Hz}$
$k_*$	$3 \times 10^{12} \text{ Mpc}^{-1}$
$A_{\mathcal{R}}$	$7.5 \times 10^{-3}$

case study!

# Anisotropies for peaked spectra

Models with sharp peaks in the scalar power spectrum (e.g. PBH production)

$$\Omega_{\text{GW,r}}(k) = 3 \int_0^\infty dv \int_{|1-v|}^{1+v} du \frac{\mathcal{T}(u,v)}{u^2 v^2} \mathcal{P}_{\mathcal{R}}(vk) \mathcal{P}_{\mathcal{R}}(uk),$$

$$\mathcal{P}_{\mathcal{R}}(k)|_{k \gg k_{\text{CMB}}} = \frac{A_{\mathcal{R}}}{\sqrt{2\pi}\Delta} \exp\left[-\frac{\ln^2(k/k_*)}{2\Delta^2}\right]$$

$\Delta$	$10^{-2}$
$f_*$	$5 \times 10^{-3} \text{ Hz}$
$k_*$	$3 \times 10^{12} \text{ Mpc}^{-1}$
$A_{\mathcal{R}}$	$7.5 \times 10^{-3}$

- the anisotropies can be typically enhanced by  $\mathcal{O}(10-100)$

$$\delta_{\text{GW}} \sim \left( \frac{\partial \ln \Omega_{\text{GW}}}{\partial \ln k} \right) \zeta_{\text{L}}$$

- the angular power spectrum of the GW anisotropies inherits the frequency dependence

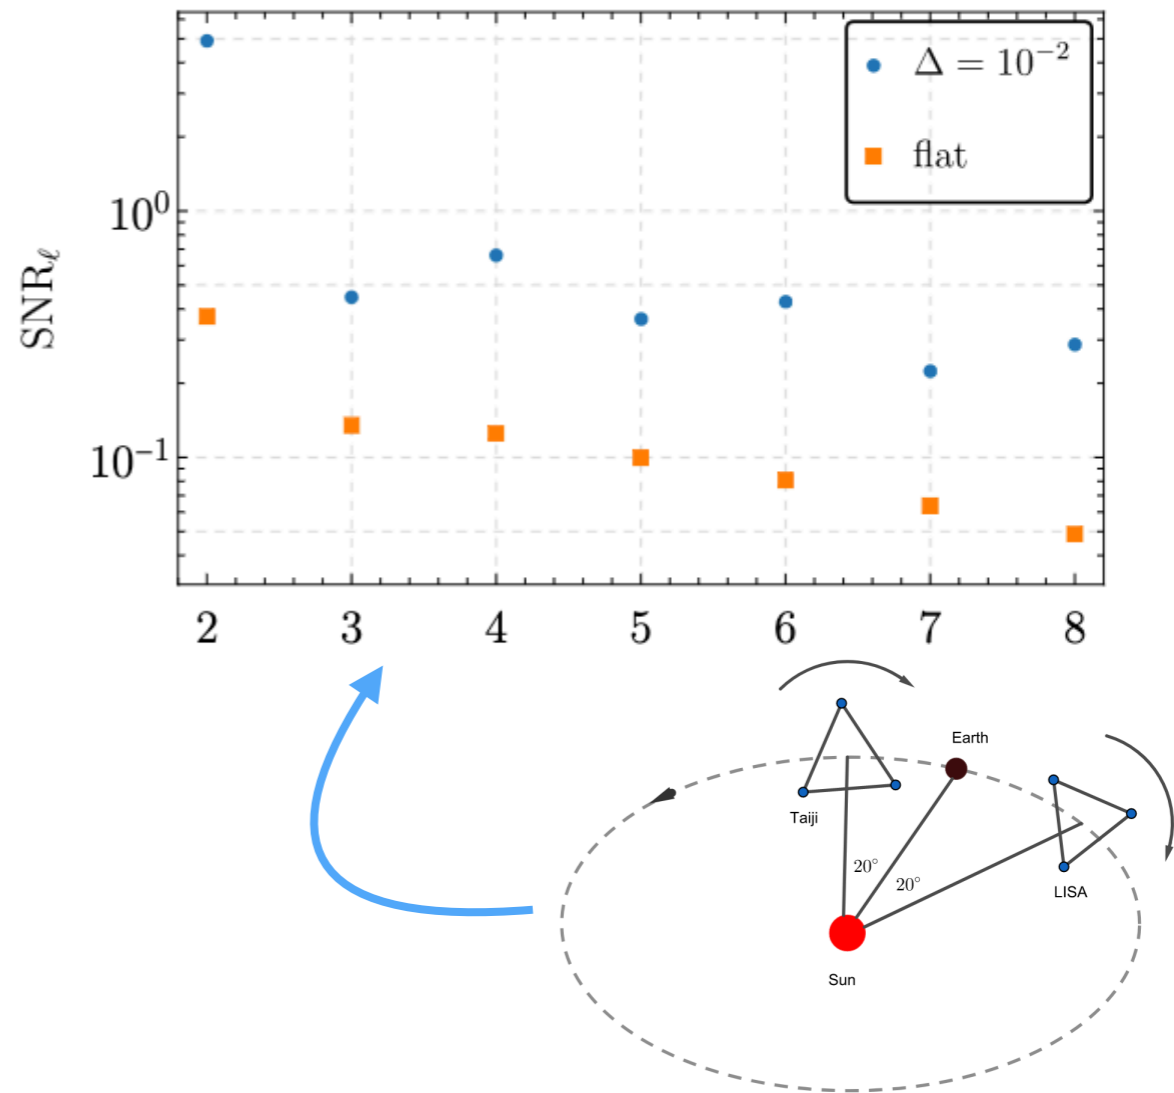

# Anisotropies for peaked spectra

Considering a flat spectrum with the same SNR for monopole as peaked spectrum:

Signal to noise ratio for the individual multipoles:

anisotropies are easier to detect compared to those of a flat spectrum!

[ED, Fasiello, Malhotra, Tasinato 2022]

# Cross-correlations

$$\text{SNR}^2 = \sum_{\ell=2}^{\ell_{\max}} \sum_{X=T,E} (2\ell + 1) \frac{(C^{\text{X}\Gamma})^2}{(C^{\text{X}\Gamma})^2 + (C_{\ell}^{\Gamma} + N_{\ell}^{\Gamma}) C_{\ell}^{\text{X}}}$$

(assuming full sky maps for both CMB and GW anisotropies)

Only valid for the specific set of values considered earlier!

# Conclusions (Part II)

- For sharply peaked GW spectra (e.g. common to PBH formation scenarios), GW background anisotropies are enhanced w.r.t. power-law GW spectra
- In spite of enhancement being limited to a small range of scales, anisotropies easier to detect relative to those of power-law spectra.
- For a representative case, a LISA-Taiji network would be able to detect quadrupole, BBO would detect GW-CMB cross-correlations
- The distinct frequency dependence of these GW anisotropies potentially useful to separate these anisotropies from those associated with other (cosmological or astrophysical) GW backgrounds

# Anisotropies from **isocurvature perturbations**

Matteo Fasiello  
(IFT Madrid)

Gianmassimo Tasinato  
(Swansea)

# Our initial question:

The observed GW background is in general determined both by:

(1) the specific source

(2) the evolution of the universe after production

In particular, an early non-standard cosmic history (e.g. early matter domination) could affect the frequency profile of  $\Omega_{\text{GW}}$  in ways that are fully degenerate w.r.t. the imprints of the GW source.

Can GW background anisotropies break this degeneracy?

How do propagation anisotropies respond to a modified cosmic evolution?

# Our findings:

universality of behaviour of anisotropies for adiabatic modes

Anisotropies unaffected by an early non-standard phase of cosmic evolution  
so long as the primordial fluctuations are adiabatic

unsurprising: conservation of superhorizon curvature perturbation

↓ in turn:

A departure from adiabaticity would break universality condition

Anisotropies as a probe of isocurvature modes

# Anisotropies in the presence of isocurvature perturbations

Discussed earlier: for adiabatic primordial perturbations:

$$\Gamma_I = -\frac{1}{2}\Phi = \frac{\zeta}{3}$$

If there is an isocurvature perturbation of GW w.r.t. another component (e.g. radiation):

$$S_{\text{GW},r} = 3(\zeta_{\text{GW}} - \zeta_r) = \frac{3}{4}(\delta_{\text{GW}} - \delta_r)$$

$$\left\{ \begin{array}{l} \zeta = \sum_i f_i \zeta_i \\ f_i \equiv \frac{\rho_i}{\rho_{\text{tot}}} \quad (\text{fractional density for the "i" component}) \\ \zeta_{\text{GW}} = -\Psi - \mathcal{H} \frac{\delta \rho_{\text{GW}}}{\rho'_{\text{GW}}} \\ (\text{curvature perturbation of GW}) \\ \Gamma_I = \frac{1}{4} \frac{\delta \rho_{\text{GW}}}{\bar{\rho}_{\text{GW}}} \quad (\text{Initial condition for GW anisotropies}) \end{array} \right.$$

$$\Gamma_I = \frac{1}{3} (1 - f_{\text{GW}}) S_{\text{GW},r} + \frac{\zeta}{3}$$

# Anisotropies in the presence of isocurvature perturbations

## Case I:

- Curvaton dominates  $\rho_{\text{tot}}$  then decays *entirely* into radiation
- Fluctuation amplitude *fixed* by CMB normalisation

$$C_\ell \propto \left[ \underbrace{-\frac{4}{3} \zeta_r j_\ell(k\eta_0)}_{4 \times \text{adiabatic term}} \right]^2 + \text{standard ISW}$$

\* Expect the GW background anisotropy map to be fully correlated with CMB

[Ameek Malhotra, ED, Guillem Domènech, Matteo Fasiello, Gianmassimo Tasinato 2023]

# Anisotropies in the presence of isocurvature perturbations

## Case II:

- Curvaton remains subdominant and decays *entirely* into GW
- Fluctuation amplitude *not fixed*
- $f_{\chi}^b \zeta_{\chi,ini} \ll \zeta_r$  ,  $\zeta_{\chi,ini} \gg \zeta_r$

$$C_{\ell} \propto \left\{ \left[ \frac{(1+w_{\chi})}{(1+w_r)} \zeta_{\chi,ini} - \frac{1}{3} \zeta_r \right] j_{\ell}(k\eta_0) \right\}^2 + \text{standard ISW}$$

\* Expect little correlations between GW background and CMB anisotropies

[Ameek Malhotra, ED, Guillem Domènech, Matteo Fasiello, Gianmassimo Tasinato 2023]

# Anisotropies in the presence of isocurvature perturbations

[Ameek Malhotra, ED, Guillem Domènech, Matteo Fasiello, Gianmassimo Tasinato 2023]

# Conclusions (Part III)

- For adiabatic primordial fluctuations, GW anisotropies are insensitive to the EoS of the early universe  $\longrightarrow$  universal behaviour
- Deviations from this universal behaviour is an indication of the presence of isocurvature fluctuations
- Isocurvature fluctuation can a sizeable enhancement of the GW anisotropies w.r.t. the adiabatic case
- GW-CMB cross-correlations can also be an effective probe for curvaton models

# Outline

- Anisotropies as a probe of **squeezed non-Gaussianity**

- Anisotropies as a probe of **primordial black holes** physics

- Anisotropies as a probe of **isocurvature perturbations**
