# FRB's dispersion measure (DM)

$$DM_{\text{FRB}} = \frac{DM_{\text{source}} + DM_{\text{HG}}}{1+z} + DM_{\text{Halos}} + DM_{\text{MW}}$$

SNR / Source Environment

Host galaxy  
 $DM_{\text{HG}}$

Diffuse IGM + halos  
 $DM_{\text{diff}}$

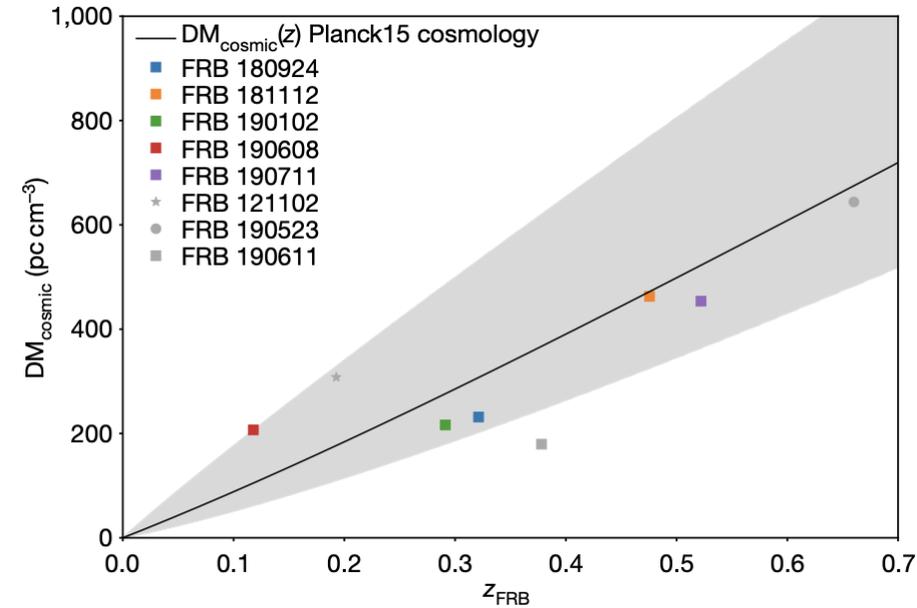

Milky Way  
 $DM_{\text{MW}}$

$DM_{\text{source}}$   
(time-evolving)

$DM_{\text{cosmo}} = DM_{\text{HG}} + DM_{\text{IGM}} + DM_{\text{Halos}}$

The dispersion measure of FRB

Large-scale simulation  
(AGN feedback effect)

DM-z relation,  
Macquart et al., 2020

## Time delay and DM

$$\Delta T_{\text{obs}} = \frac{e^2}{2\pi m_e c \nu_c^2} \int_0^L \frac{n_{e,p}}{1+z} dl_p = \frac{e^2}{2\pi m_e c \nu_c^2} DM$$

$$DM = \frac{c}{H_0} \int_0^L \frac{n_{e,c}(1+z) dz}{\sqrt{\Omega_m(1+z)^3 + \Omega_\Lambda}}$$

$$n_{e,p} = n_{e,c} (1+z)^3$$

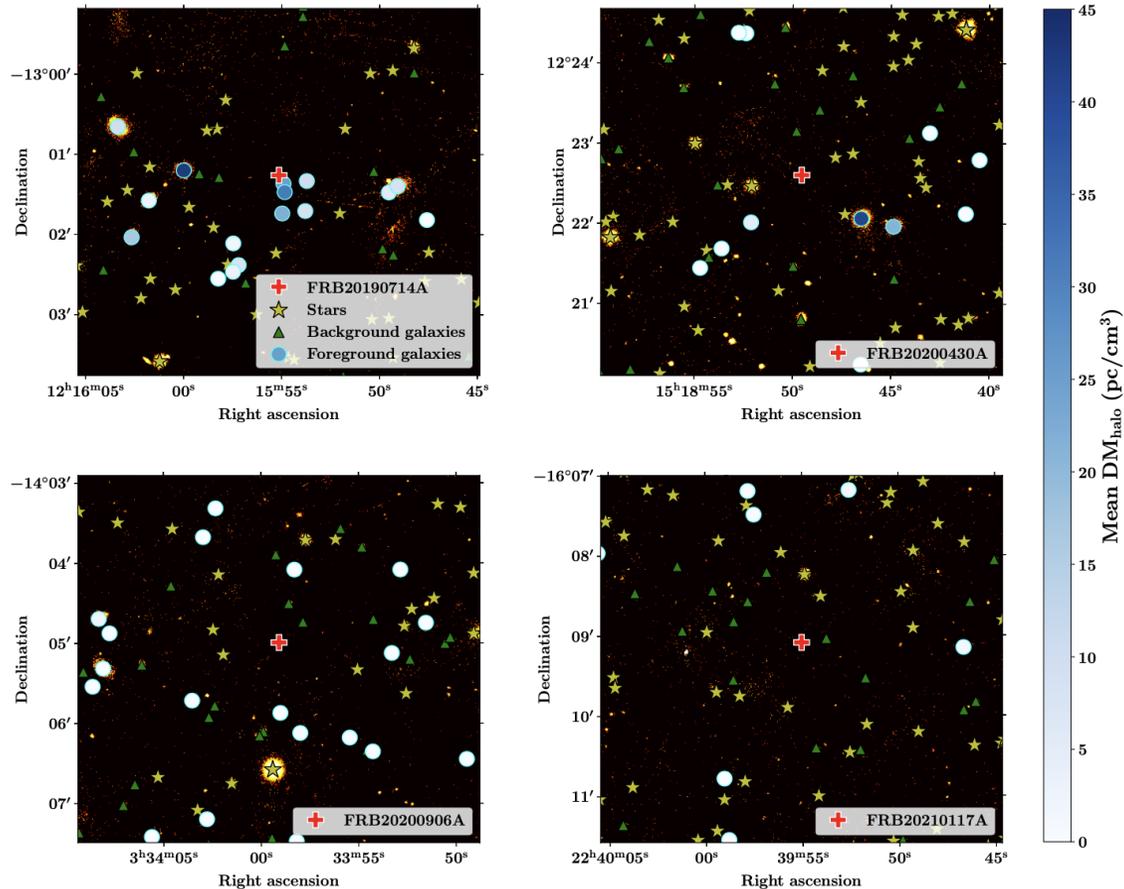

## $DM_{\text{diff}} - z$ relations

$$DM_{\text{diff}} = f_{\text{diff}} \frac{\rho_{c,0} \Omega_b}{m_p} \frac{c}{H_0} \int_0^z \frac{\chi_e(z')(1+z')}{E(z')} dz'$$

$f_{\text{diff}} = f_{\text{Halos}} + f_{\text{IGM}}$  → mass fraction of baryons in the IGM

$$E(z) = \sqrt{\Omega_m(1+z)^3 + \Omega_\Lambda}$$

# Foreground Galaxies Survey

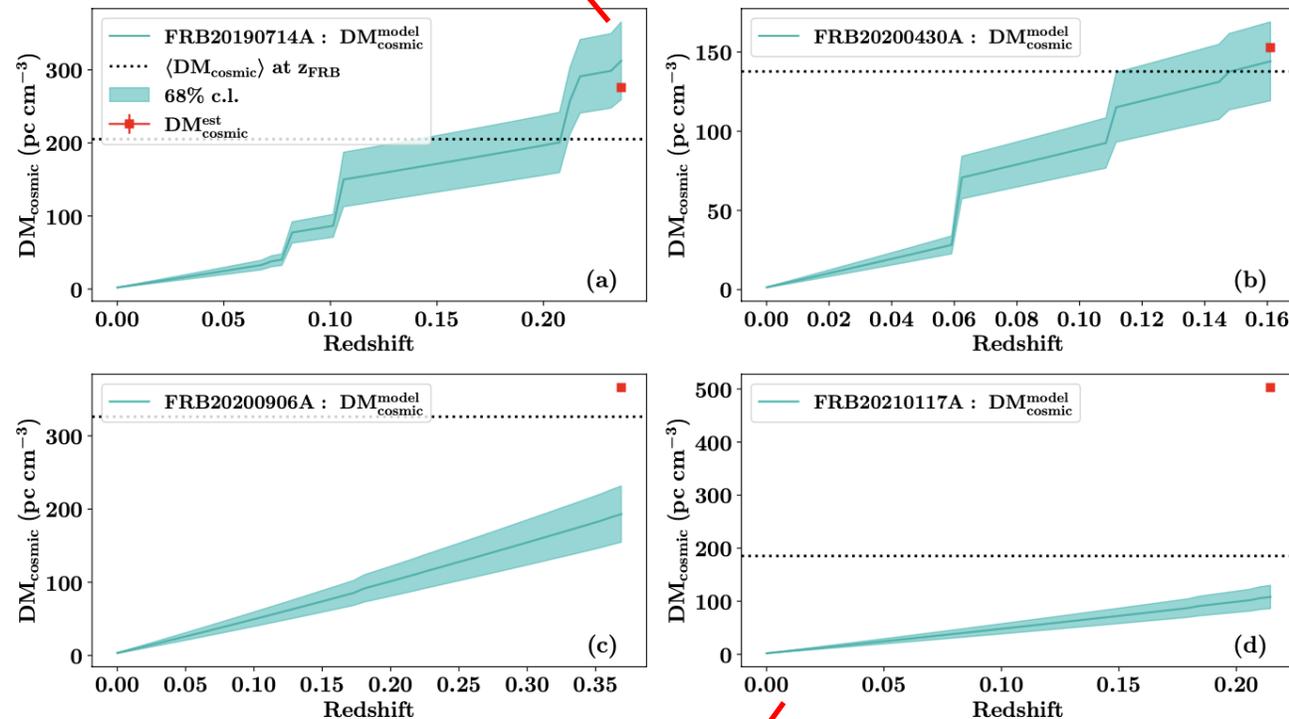

Zoomed-in (5' × 5') fields for four FRB sightlines

Simha et al , 2023

Foreground data enable FRB cosmology more accurate!

Well explained by foreground data

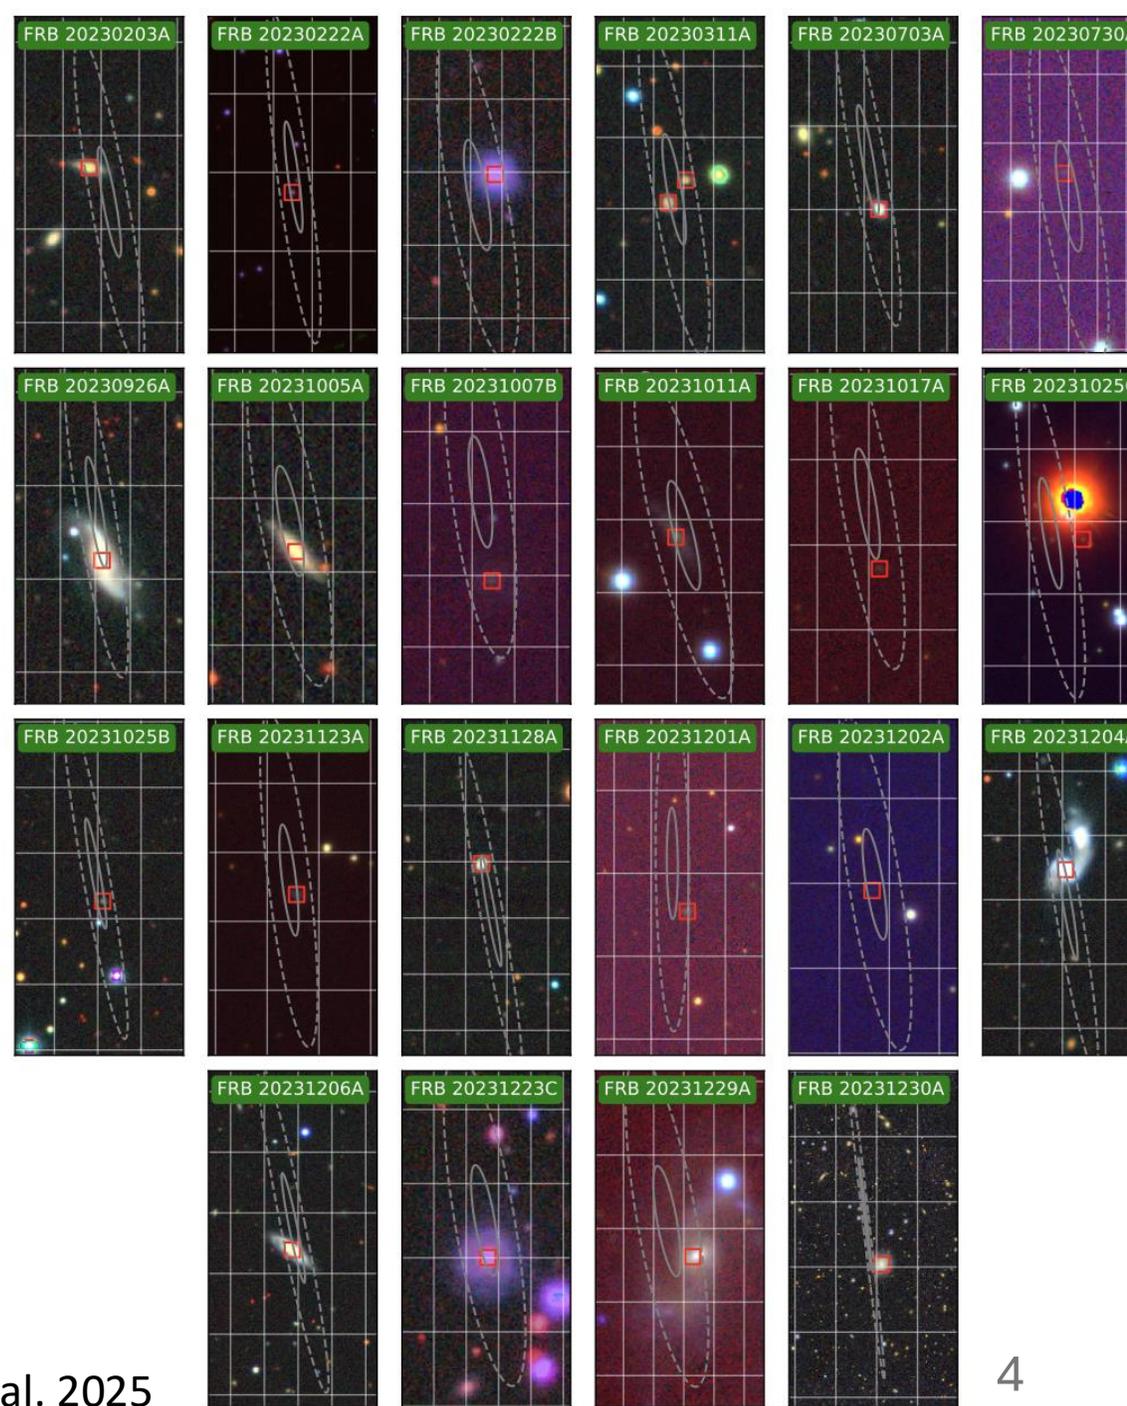

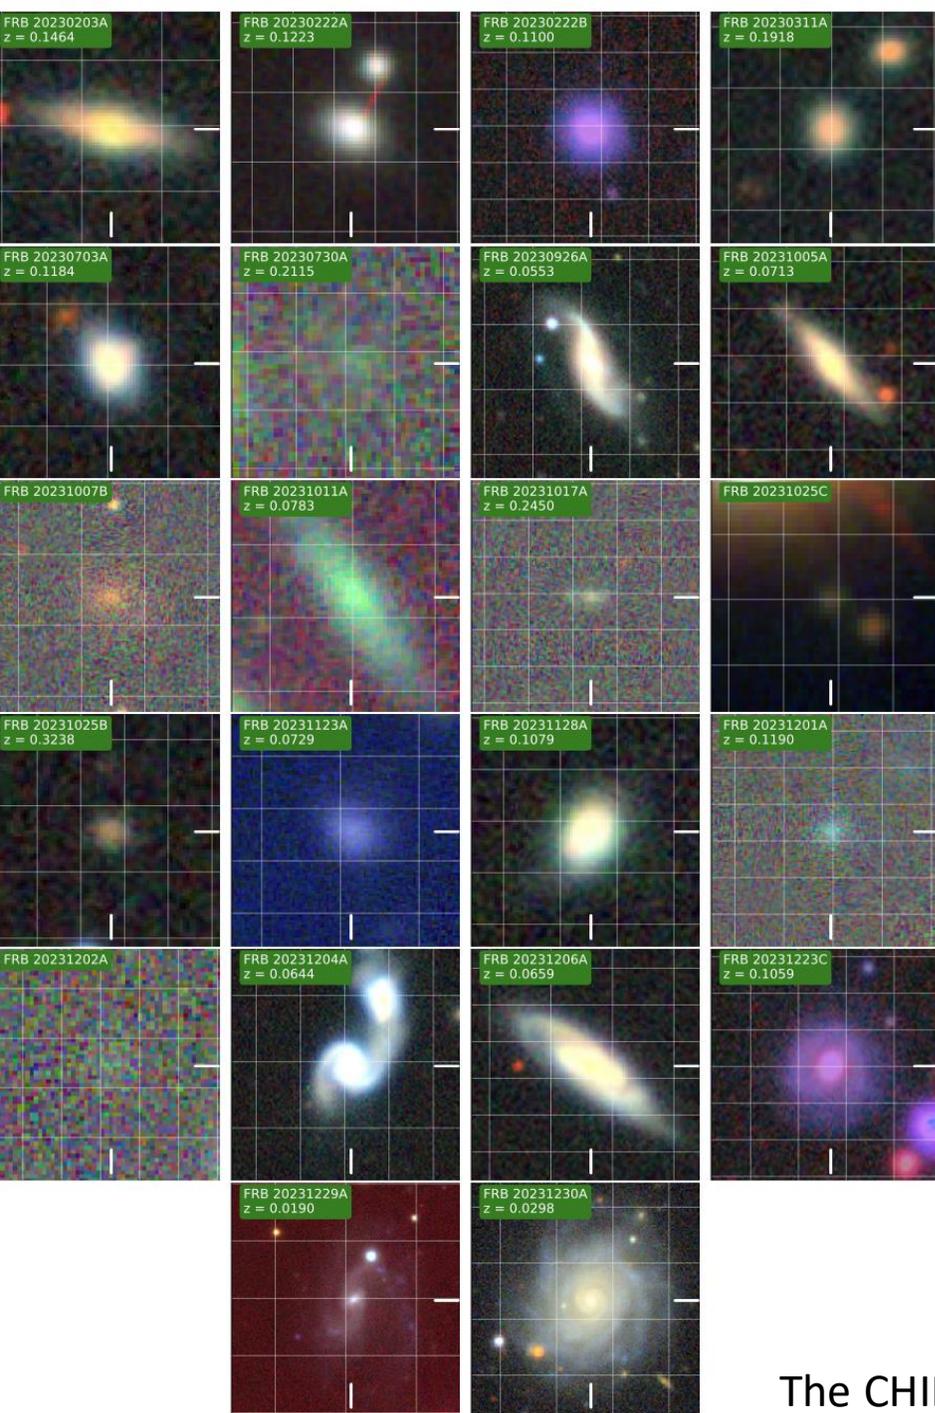

Estimates of  $DM_{\text{cosmic}}$  for the FRB sightlines vs redshift

Simha et al , 2023

Reason?

- Dwarf galaxy? (large-aperture: e. g., LSST)
- Excess of  $DM_{\text{host}}$ ?

# Host Galaxies

**Table 1.** Summary of single-star and binary-stripped progenitor models.

Channel	$M_{ZAMS}$ ( $M_{\odot}$ )	$\Delta M_{wind}$ ( $M_{\odot}$ )	$\Delta M_{RLOF}$ ( $M_{\odot}$ )	$M_{ej}$ ( $M_{\odot}$ )	$E_{SN}$ ( $10^{51}$ erg)	$M_{rem}$ ( $M_{\odot}$ )	Fate
Single	11	1.64	–	7.83	1.0	1.53	NS
Binary	11	0.70	7.12	1.81	1.0	1.62	NS
Single	30	15.74	–	12.27	1.0	1.99	NS
Binary	30	7.50	10.94	9.85	1.0	1.71	NS

## Data sets

$M_{ZAMS}$ : zero-age -main-sequence mass

$\Delta M_{wind}$ : wind loss mass

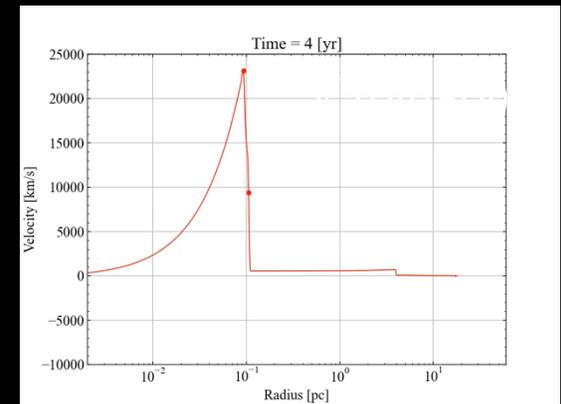

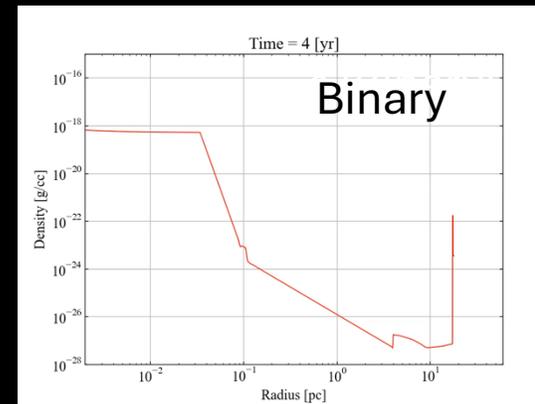

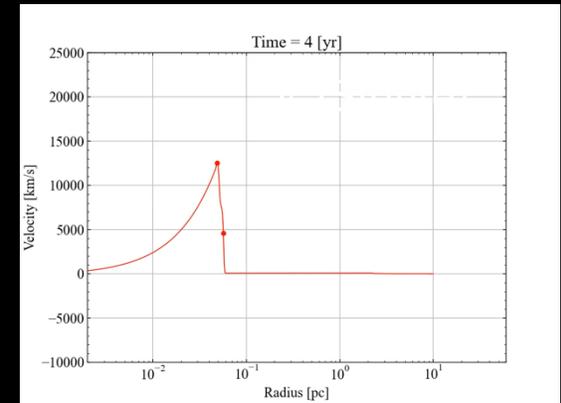

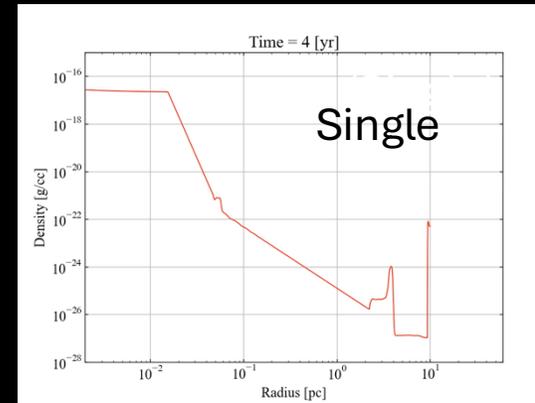

$\Delta M_{RLOF}$ : mass loss from Roche-lobe outflow

$M_{rem}$ : remnant mass or compact object mass

$M_{ej}$ : ejecta mass

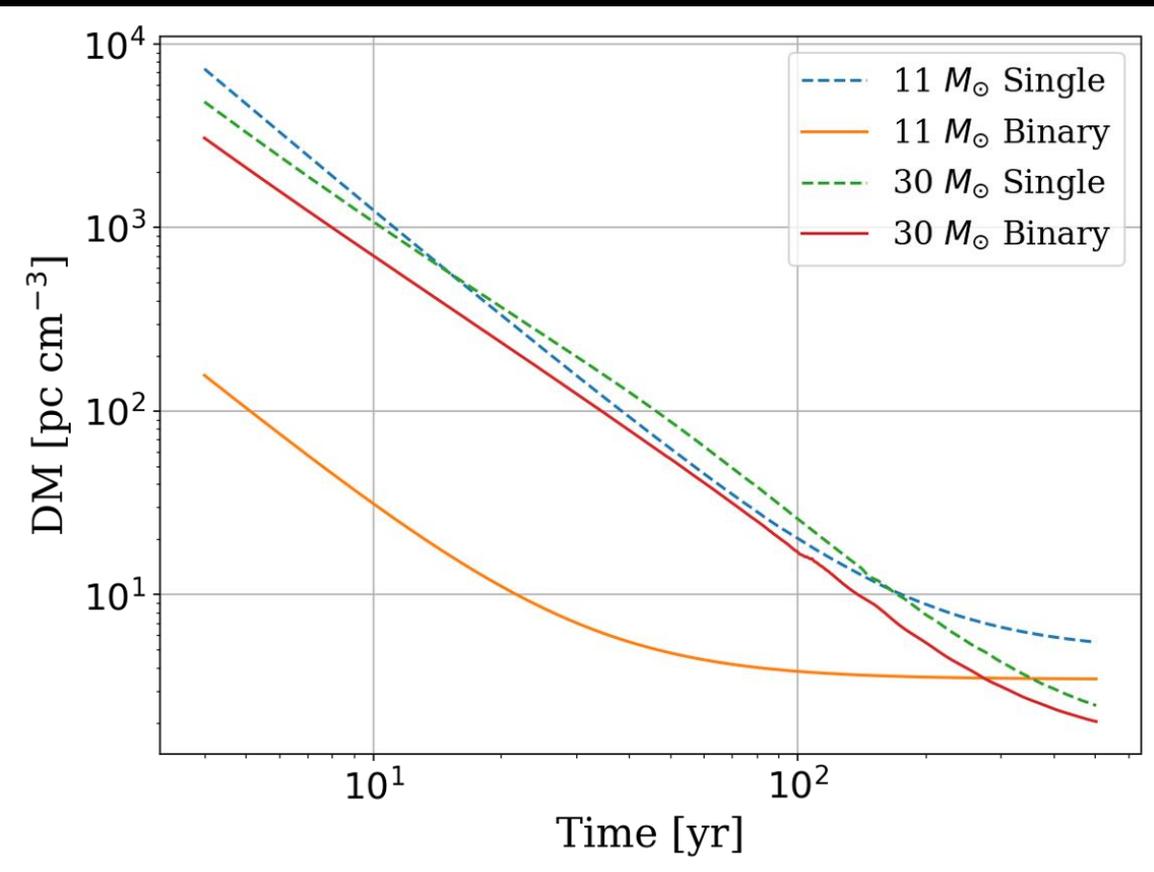

$$M_{ej} = M_{ZAMS} - \Delta M_{wind} - \Delta M_{RLOF} - M_{rem}$$

$11 M_{\odot}$ :

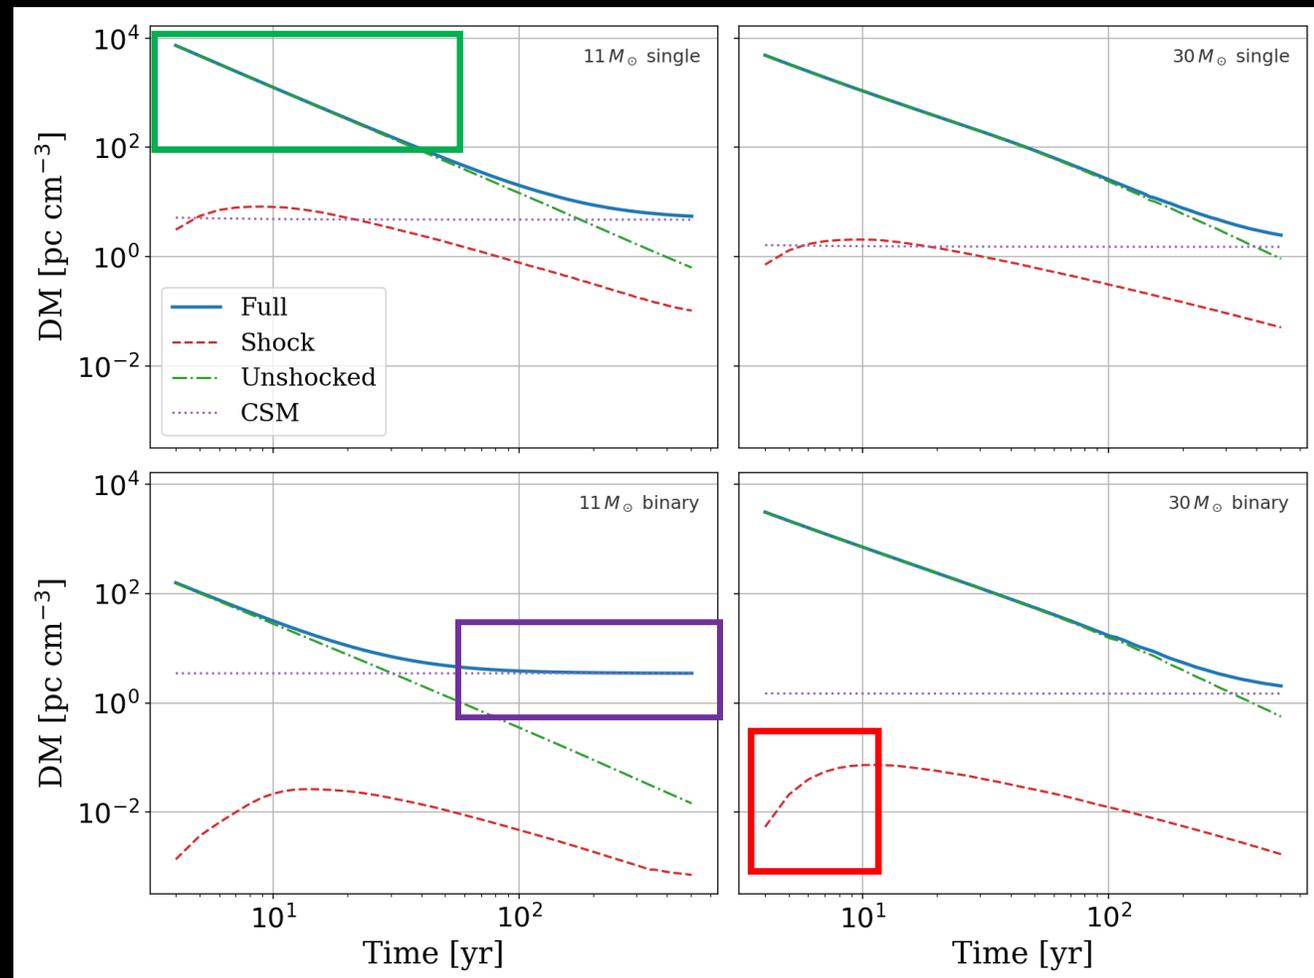

Density and wind velocity evolution

# DM evolution with different components

DM evolution

Single > Binary

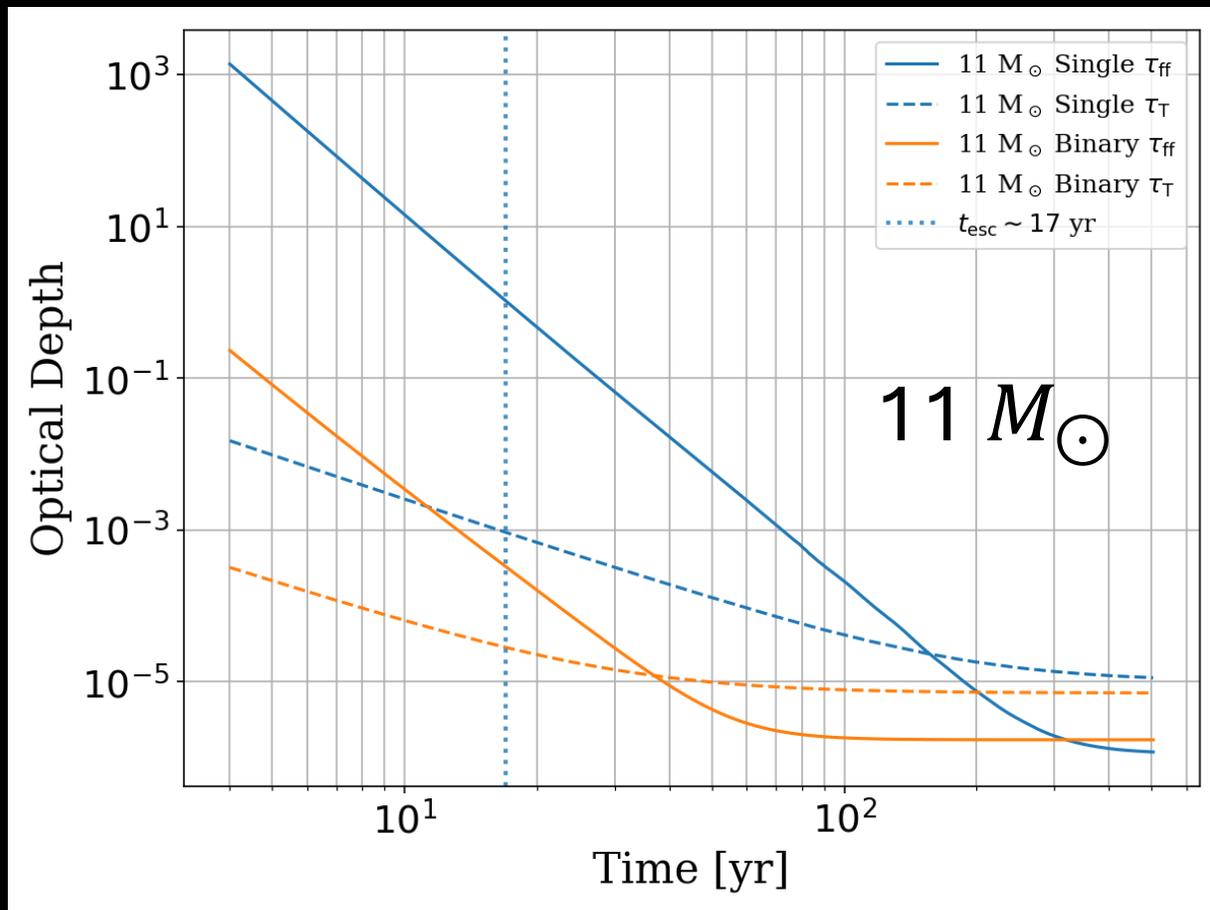

Components contribute to DM

Unshocked ejecta dominate the early phase

CSM matters in late phase (especially in  $11 M_{\odot}$ )

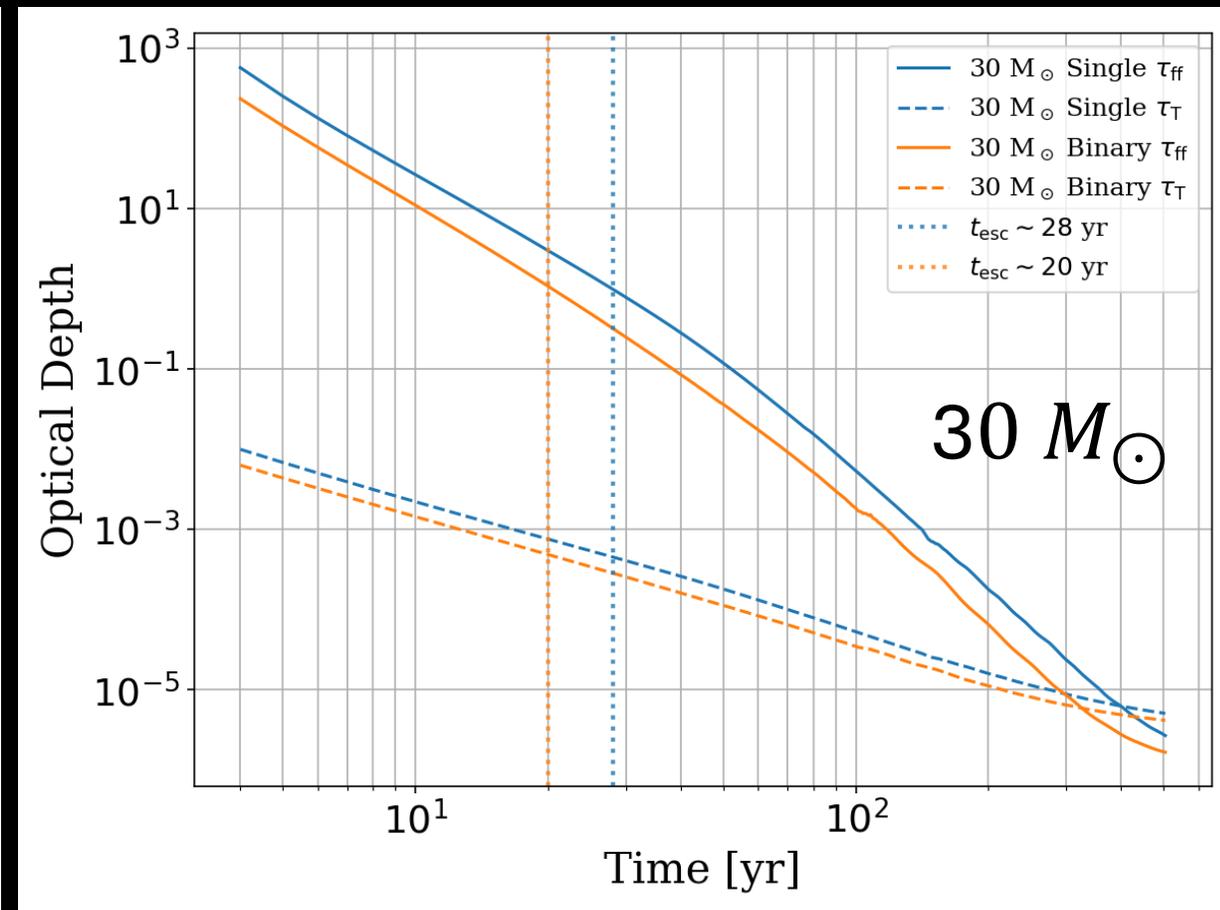

Shocked region is negligible (show NEI effect)

# Optical Depth evolution

11  $M_{\odot}$  single:  $t_{\text{esc}} \sim 17$  yr

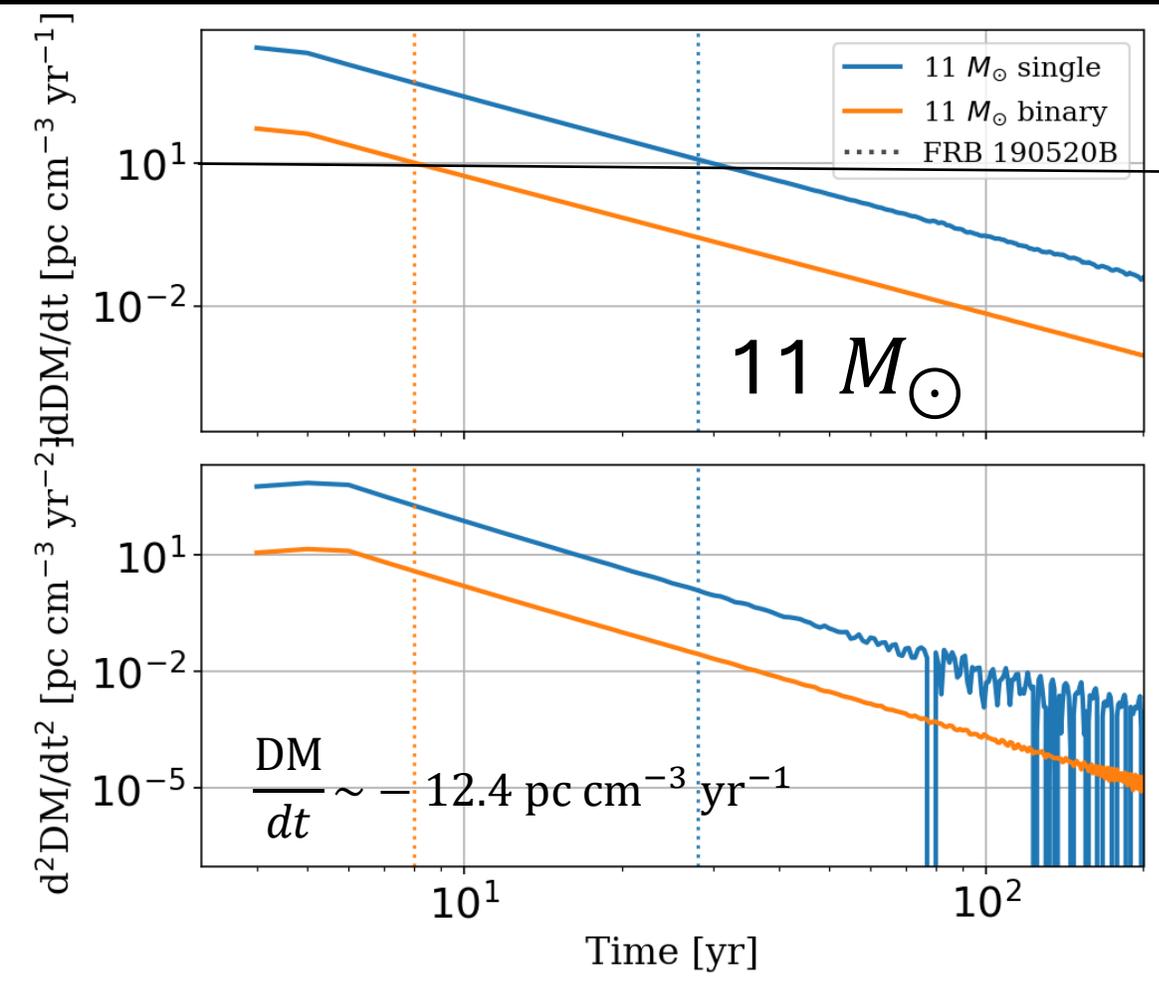

11  $M_{\odot}$  single: always transparent

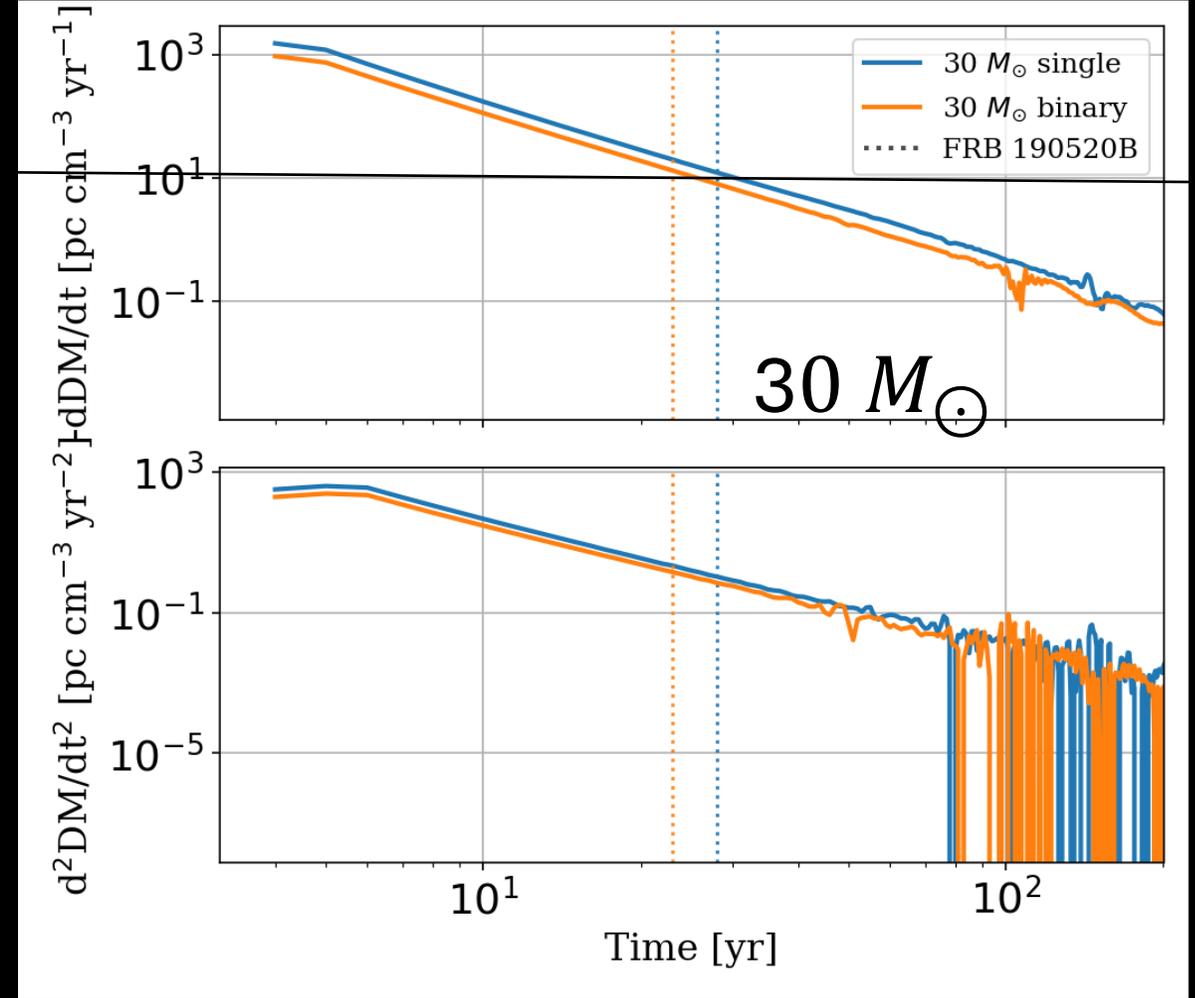

30  $M_{\odot}$  single:  $t_{\text{esc}} \sim 28$  yr

30  $M_{\odot}$  single:  $t_{\text{esc}} \sim 17$  yr

# DM time derivatives constrained by FRB 190529B

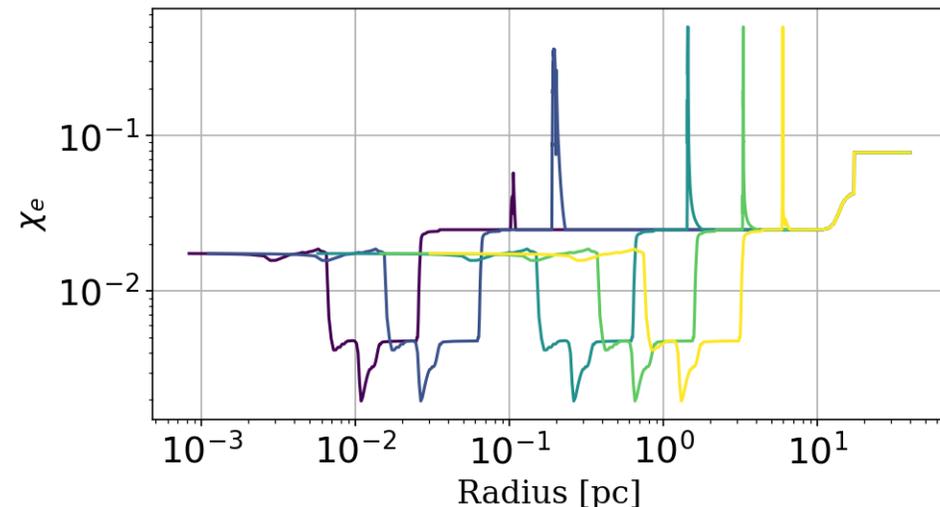

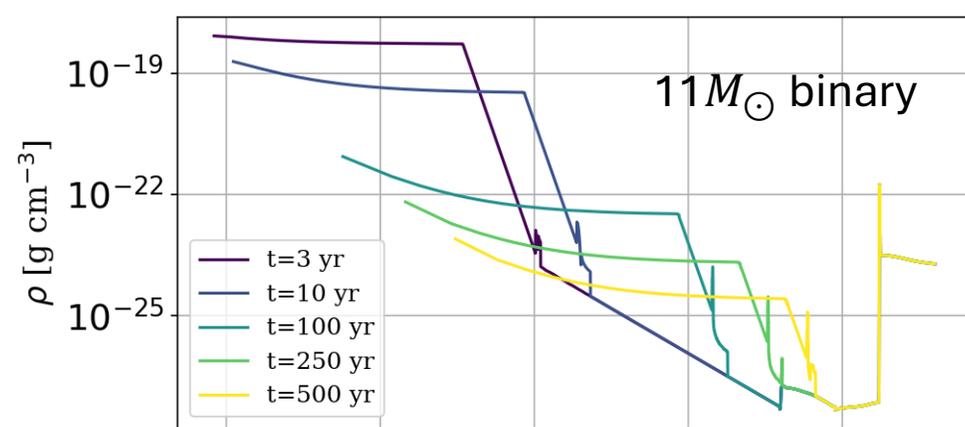

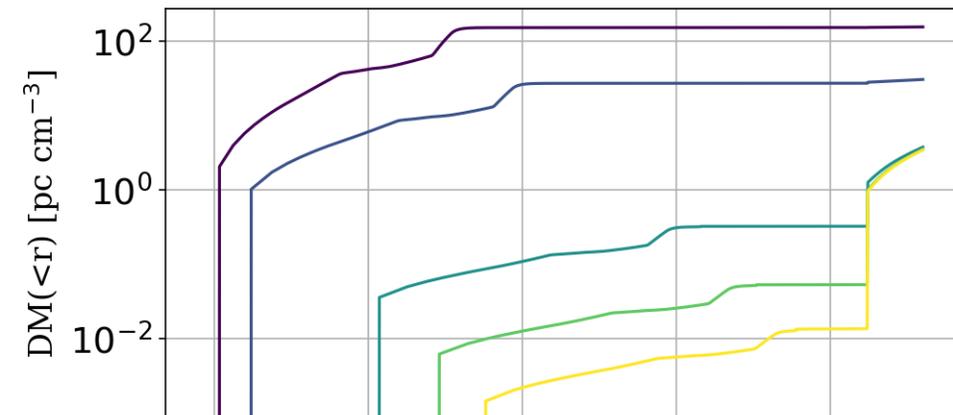

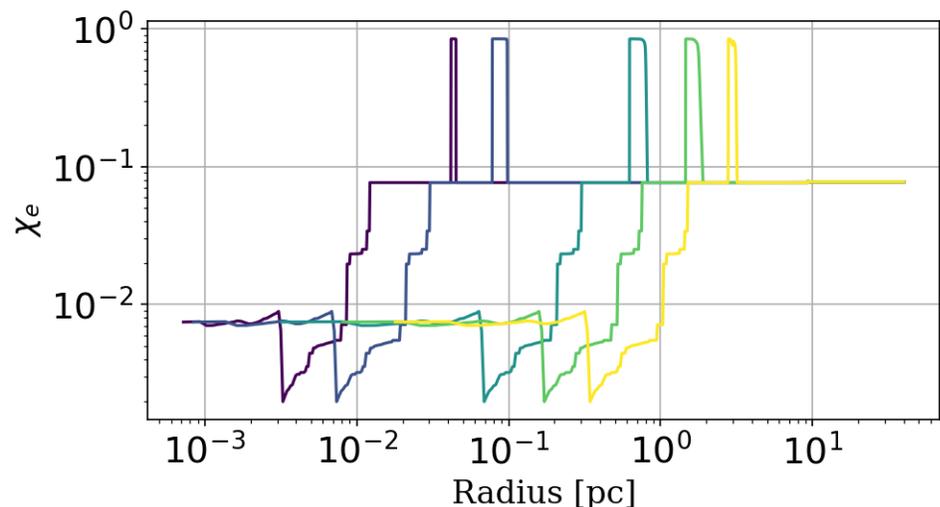

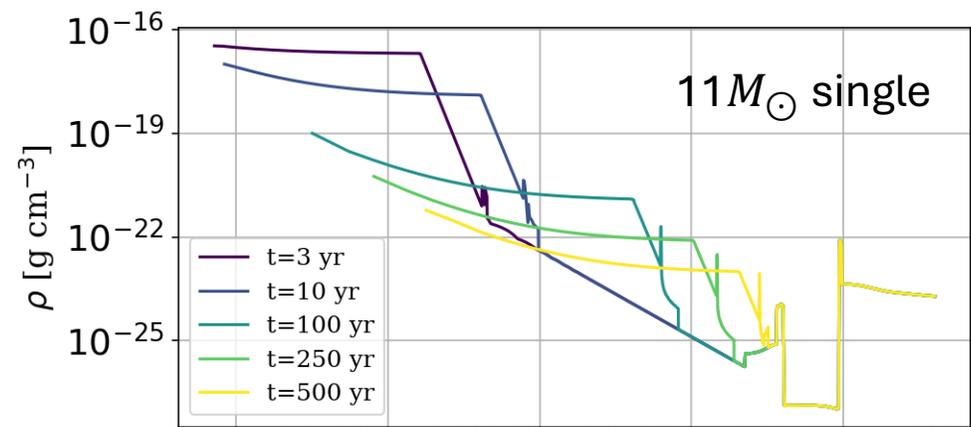

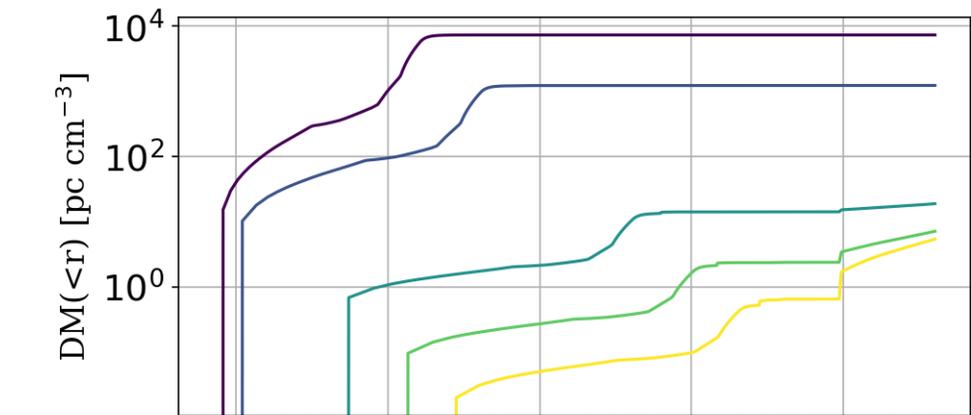

$11 M_{\odot}$  single:  $t_{\text{occur}} = 28.0 \text{ yr} > t_{\text{esc}}$   
 $11 M_{\odot}$  binary:  $t_{\text{occur}} = 8.0 \text{ yr} > t_{\text{esc}}$

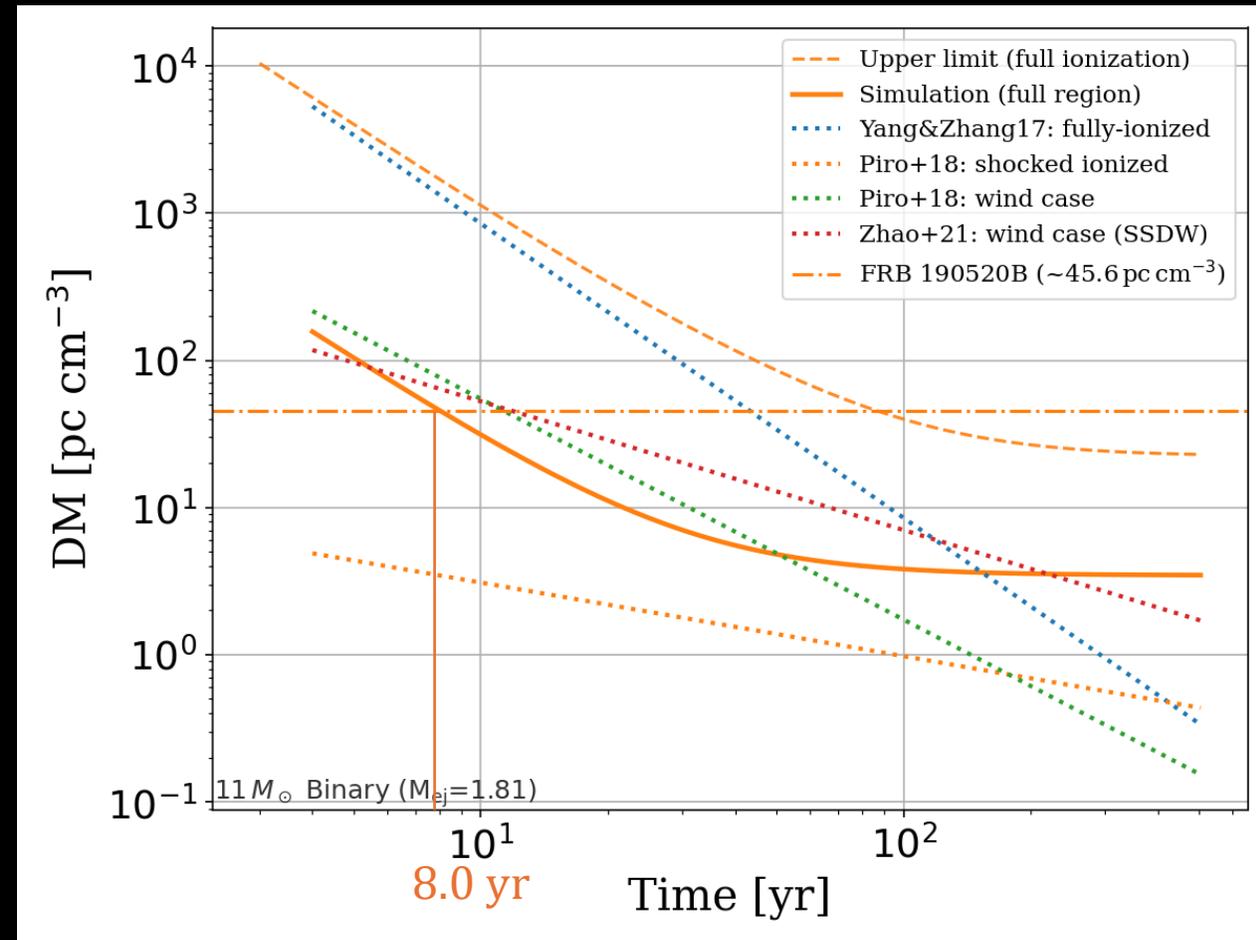

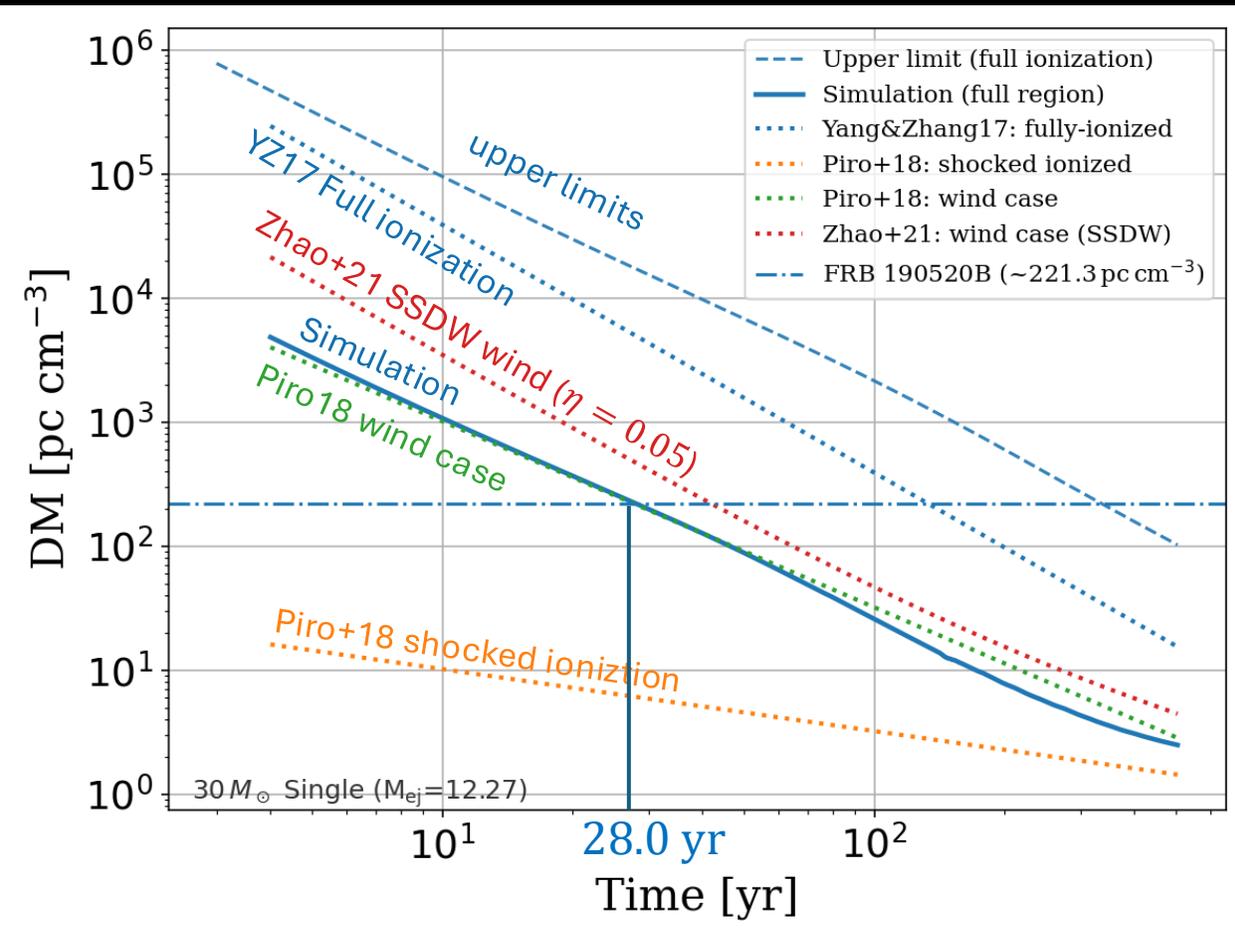

$30 M_{\odot}$  single:  $t_{\text{occur}} = 28.0 \text{ yr} = t_{\text{esc}}$   
 $30 M_{\odot}$  binary:  $t_{\text{occur}} = 23.0 \text{ yr} > t_{\text{esc}}$

FRB can escape from all of them

# Comparison with analytical model

$DM_{\max} \sim 221.3$  pc cm<sup>-3</sup> from 30  $M_{\odot}$  single

$DM_{\min} \sim 45.6$  pc cm<sup>-3</sup> from 11  $M_{\odot}$  binary

$DM_{\text{source}}$

# Summary

Probing cosmic baryons from FRB DM analysis based on CROCODILE simulation:

- Constructed **light cone** data using CROCODILE dataset
- $f_{\text{diff}} = 0.865^{+0.101}_{-0.165}$  (Fiducial) and  $f_{\text{diff}} = 0.856^{+0.101}_{-0.162}$  NoBH)
- Examined the DM-b relation for foreground galaxy contribution
- Estimated the intrinsic  $f_{\text{IGM}}$  evolution by deducting halo gas.
- DM distribution of **Host Galaxies** in different types and locations

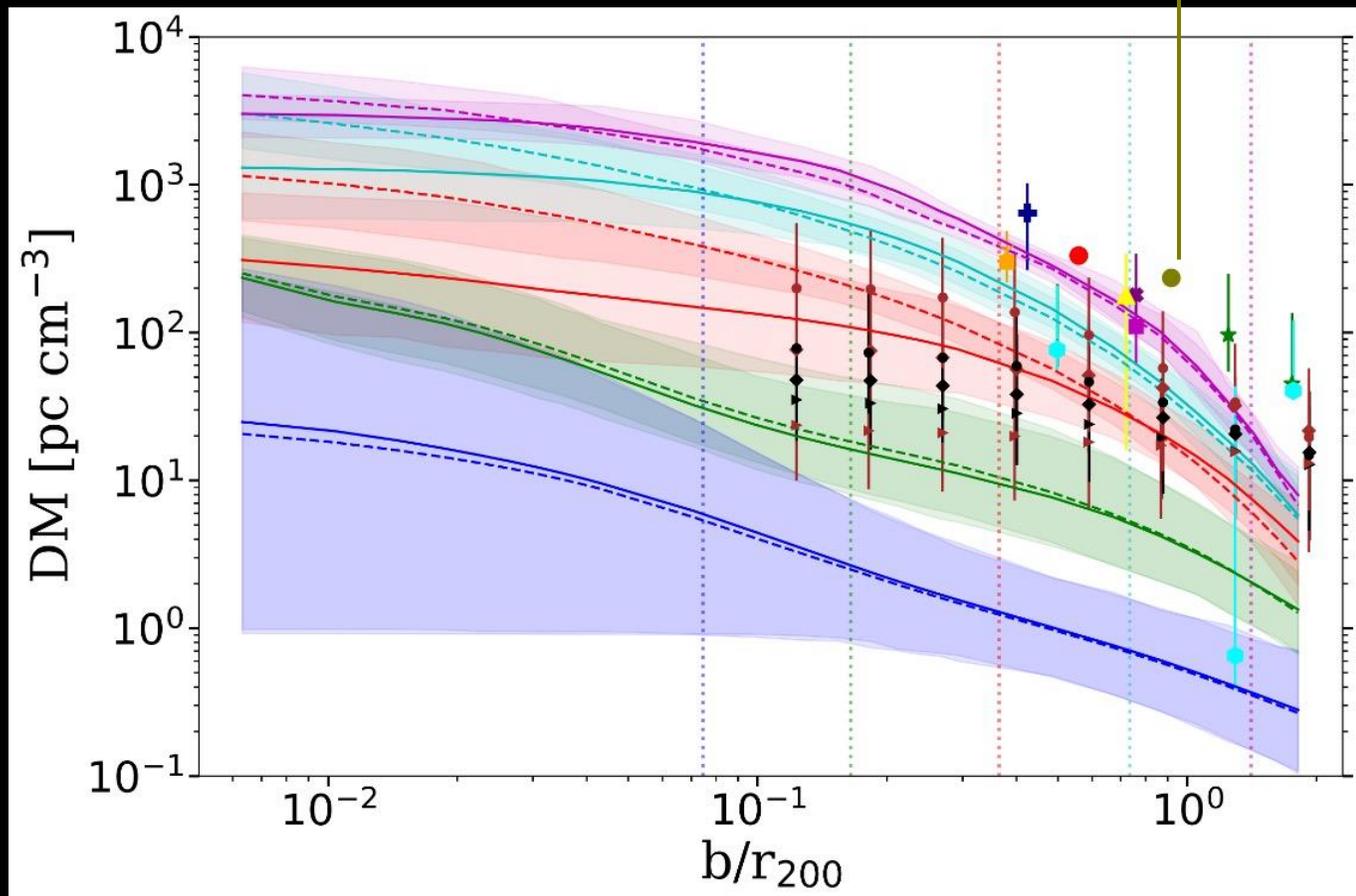

Local FRB Environments and DM Evolution based on SNR simulation analysis:

- DM and  $\tau$  evolution of **11** and **30**  $M_{\odot}$  progenitors in both **single** and **binary** channels.
- DM contribution **varies substantially** from different channels.
- $\text{DM}_{\text{SNR}}$  is dominated by the **unshocked ejecta** and CSM matters in later time.
- FRB 20190520B **can escape** in all cases and give different DM constraints
