

## A classification of free fermion topological phases under **order-two point group symmetries**

### ● $Z_2$ Global

$$(x, y, z) \mapsto (x, y, z)$$

### ● Reflection

$$(x, y, z) \mapsto (-x, y, z)$$

### ● $C_2$ -rotation

$$(x, y, z) \mapsto (-x, -y, z)$$

### ● Inversion

$$(x, y, z) \mapsto (-x, -y, -z)$$

### Results:

- ✓ New periodicity in number of coordinate under order-two point group symmetry
- ✓ A defect gapless state can be considered as a boundary gapless state.
- ✓ A classification of stable fermi points
