SMALL-SCALE FLUCTUATIONS OF RELIC RADIATION

9

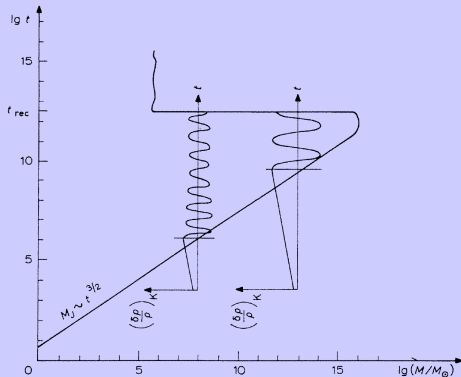

Fig. 1a. Diagram of gravitational instability in the 'big-bang' model. The region of instability is located to the right of the line $M_J(t)$; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Ekpyrosis

String
Cosmology

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

- Inflation renders the universe large, homogeneous and spatially flat, i.e. **solution of the horizon and flatness problems of SBB cosmology**
- Classical matter redshifts \rightarrow matter vacuum remains
- **Quantum vacuum fluctuations: seeds for the observed density fluctuations** [Chibisov & Mukhanov, 1981] and **gravitational waves** (Starobinsky, 1978).
- **Approximately scale-invariant spectra** of density fluctuations and gravitational waves.
- **Small red tilt** of the spectrum of density fluctuations.
- **Prediction: Small red tilt** of the spectrum of gravitational waves.

Obtaining Inflation

String
Cosmology

R. Branden-
berger

Introduction

Challenges

Ekyrosis

String
Cosmology

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

- Assumption: Space-time described by General Relativity.
- → require matter with $p < -\frac{1}{3}\rho$.
- Consider scalar field φ as matter.
- In contrast to other matter fields, scalar fields have a **potential energy term** $V(\varphi)$.
- Potential energy has an equation of state $p = -\rho$.

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

- Assumption: Space-time described by General Relativity.
- \rightarrow require matter with $p < -\frac{1}{3}\rho$.
- Consider **scalar field** φ as matter.
- In contrast to other matter fields, scalar fields have a **potential energy term** $V(\varphi)$.
- Potential energy has an equation of state $p = -\rho$.

Obtaining Inflation II

String
Cosmology

R. Branden-
berger

Introduction

Challenges

Ekyptosis

String
Cosmology

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

- Other forms of energy have equations of state with $\rho > -\frac{1}{3}\rho$ which do not yield inflation.
- Thus one needs to ensure that potential energy dominated over other forms of energy!

- Require a **slowly rolling** scalar field:

$$\frac{V'}{V} \ll \frac{1}{m_{pl}}.$$

- Require rolling over large distances

$$\Delta\varphi > m_{pl}.$$

Initial Conditions for Inflation

String
Cosmology

R. Branden-
berger

Introduction

Challenges

Ekyrosis

String
Cosmology

String Gas
Cosmology

Matrix Theory
Cosmology

Conclusions

Large field inflation is a **local attractor** in initial condition space (J. Kung and RB, 1990; RB, arXiv:1601.01918).

Fine tuning of initial conditions required for **small field inflation** (D. Goldwirth and T. Piran 1992).

Note: Tuning of the initial spatial curvature required (also for large field inflation).

Problems of the Inflationary Scenario

String
Cosmology

R. Branden-
berger

Introduction

Challenges

Ekyptosis

String
Cosmology

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

- **Singularity problem** persists.
- How does one obtain inflation?
- Inflation takes place at energy scales close to the Planck scale.
- At this scale **quantum effects of gravity** should be important.
- **Effective field theory** analysis of inflationary cosmology is unable to handle this problem.

Trans-Planckian Problem

J. Martin and R.B., *Phys. Rev. D*63, 123501 (2002)

String
Cosmology

R. Branden-
berger

Introduction

Challenges

Ekyprosis

String
Cosmology

String Gas
Cosmology

Matrix Theory
Cosmology

Conclusions

- **Success of inflation:** At early times scales are inside the Hubble radius \rightarrow causal generation mechanism is possible.
- **Problem:** If time period of inflation is more than $70H^{-1}$, then $\lambda_p(t) < l_{pl}$ at the beginning of inflation.
- \rightarrow breakdown of effective field theory; new physics MUST be taken into account when computing observables from inflation.

Trans-Planckian Censorship Conjecture (TCC)

Conclusions

- **Ekpyrotic Scenario**: **Bouncing cosmology** with a phase of very slow contraction.
- Among bouncing models the Ekpyrotic scenario has distinct advantages:
- Dilutes anisotropies.
- Creates spatial flatness.
- Attractor in initial condition space.
- Thus, the Ekpyrotic scenario shares the same nice features with **large field** inflation.

Ekpyrotic Bouncing Scenario

Ekpyrosis: Phase of **very slow contraction**:

$$a(t) \sim (-t)^p \quad (t < 0)$$

$$p \ll 1.$$

In conformal time ($ad\tau = dt$):

$$a(\tau) \sim (-\tau)^q \quad (\tau < 0)$$

$$q = \frac{p}{1-p}.$$

This can be obtained using GR plus scalar field matter with a negative exponential potential

$$V(\varphi) = -V_0 e^{-\sqrt{2/p}\varphi/m_{pl}}$$

Challenges for the Ekpyrotic Scenario

Challenges for the Ekpyrotic Scenario:

- How is the bounce realized?
- How does one obtain a spectrum of almost scale-invariant cosmological perturbations?
- Are gravitational waves produced with a significant amplitude on cosmological scales?

Note: Previous realizations of Ekpyrosis

- Require extra/new matter fields to obtain a non-singular bounce.
- Require extra matter fields to obtain cosmological perturbations with an approximately scale-invariant spectrum.
- Predict a vacuum spectrum of gravitational waves.

Cosmology

Conclusions

Our work:

- **S-brane** mediates a **continuous bounce**.
- **Gravitational waves** passing through the brane acquire a **scale-invariant spectrum**.
- If the S-brane has zero shear, then a **scale-invariant spectrum of curvature fluctuations** is generated.
- **Two consistency relations** among the four basic cosmological observables.

Idea: make use of the **new symmetries** and **new degrees of freedom** which string theory provides to construct a new theory of the very early universe.

Assumption: Matter is a gas of fundamental strings

Assumption: Space is compact, e.g. a torus.

Key points:

- **New degrees of freedom:** string oscillatory modes
- Leads to a **maximal temperature** for a gas of strings, the Hagedorn temperature
- **New degrees of freedom:** string winding modes
- Leads to a **new symmetry:** physics at large R is equivalent to physics at small R

Conclusions

- Winding modes prevent space from expanding.
- Momentum modes prevent space from shrinking.
- Expansion of space requires decay of winding modes.
- Since winding strings are **two-dimensional world sheets**, their interaction rate vanishes in more than four space-time dimensions.
- → **only three spatial dimensions can become large.**

Note: string gases can play a key role in the stabilization of both size and shape moduli.

Conclusions

- Eigenvalues of A_0 become **emergent time**, continuous in $N \rightarrow \infty$ limit.
- Work in the basis in which A_0 is diagonal: X_i matrices become block diagonal \rightarrow **emergent space**, continuous in $N \rightarrow \infty$ limit.
- Extent of space:

$$x_i(t)^2 \equiv \left\langle \frac{1}{n} \text{Tr}(\bar{X}_i(t))^2 \right\rangle ,$$

- Local Lorentz invariance emerges in $N \rightarrow \infty$ limit.

Conclusions

A second view:

$$u \equiv \frac{m_{pl}}{\mathcal{H}} a \Phi .$$

It obeys the mode equation

$$u_k'' + \left(k^2 - 2\mathcal{H}^2 - \frac{a''}{a} \right) u_k = 0 ,$$

On super-Hubble scales this becomes

$$u_k'' - q(-\tau)^{-2} u_k = 0 ,$$

growing mode with

$$u_k \sim (-\tau)^{-q} \sim a(\tau)^{-1} ,$$

Conclusion: Vacuum initial spectrum is transformed to a **scale-invariant** spectrum with a slight **red tilt**.

Key Question

Introduction

Challenges

Ekyrosis

String
Cosmology

String Gas
Cosmology
Matrix Theory
Cosmology

Conclusions

Which variable passes through the bounce continuously?

Some previous results:

- At the reheating transition in inflationary cosmology it is the variable v which is continuous, and Φ jumps (by a large factor).
- In models with a smooth bounce mediated by matter which violates the Null Energy Condition the variable v is continuous, and not Φ .
- For a space-like matching surface, most choices of the location of the surface lead to Φ being continuous (Durrer and Vernizzi, Phys. Rev. D **66**, 083503 (2002)).

Cosmology

Conclusions

- Consider the equation

$$X''_k(\tau) + [k^2 + m\delta(\tau - \tau_B)]X_k(\tau) = 0.$$

- Solutions: plane waves for $\tau < \tau_B$ and for $\tau > \tau_B$.
- Positive frequency solutions f_k and negative frequency ones f_k^* .
- **Bogoliubov mode mixing across the transition surface.**
- Pure positive frequency before τ_B can be written for $\tau > \tau_B$ as

$$X_k = \alpha_k f_k + \beta_k f_k^*,$$

- where α_k and β_k are the Bogoliubov mode matching coefficients.

Conclusions

Solution for Φ on super-Hubble scales in the contracting phase:

$$\Phi_{-}(k, \tau) = A_{-}(k) \frac{\mathcal{H}}{a^2} + B_{-}(k),$$

Solution for Φ on super-Hubble scales in the expanding phase:

$$\Phi_{+}(k, \tau) = A_{+}(k) \frac{\mathcal{H}}{a^2} + B_{+}(k).$$

Matching Conditions

- Continuity of the induced metric fluctuations.
- Extrinsic curvature jump given by the fluctuations of the tension of the S-brane.

Matching conditions for a **zero shear S-brane** (R. Durrer and F. Vernizzi, Phys. Rev. D **66**, 083503 (2002)):

$$A_+ = \frac{\mathcal{H}_-}{\mathcal{H}_+} A_- + \frac{a_B^2}{\mathcal{H}_+} (B_- - B_+)$$

$$B_+ = \left(\frac{\mathcal{H}_+ (\mathcal{H}_-'/\mathcal{H}_- - \mathcal{H}_-) - \mathcal{H}_+' + \mathcal{H}_+^2}{2\mathcal{H}_+^2 - \mathcal{H}_+'} \right) \frac{\mathcal{H}_-}{a_B^2} A_- \\ + \left(1 + \frac{\mathcal{H}_- \mathcal{H}_+ - \mathcal{H}_+^2}{2\mathcal{H}_+^2 - \mathcal{H}_+'} \right) B_- ,$$

Curvature Fluctuations Passing Through the S-Brane II

Result of the matching:

$$B_+(k) \simeq -\frac{\mathcal{H}_+}{a_B^2} \frac{1}{3q} A_-(k).$$

Using vacuum initial conditions to determine $A_-(k)$:

$$A_-(k) \simeq 2^\mu \Gamma(\mu) m_{pl}^{-1} k^{-3/2} (k\tau_B)^{-q},$$

Power Spectrum of Cosmological Perturbations:

$$\mathcal{P}_\Phi(k) \simeq \frac{1}{2\pi^2} (k\tau_B)^{-2q} \left(\frac{\mathcal{H}_+}{a_B^2 m_{pl}}\right)^2 \frac{1}{9q^2} 2^{2\mu} \Gamma(\mu)^2.$$

Scale-invariant spectrum with a slight red tilt.
