# QCD is a theory of quarks & gluons

In the vacuum, only hadrons (mesons, baryons).

→ Can one calculate *the nucleon mass*  $m_N \sim 939$  MeV ?  
(Lattice QCD, holographic QCD ?...).

→ Low-energy QCD is described by mesons(pions,  $\eta$ ) or Nambu-Goldstone modes. Chiral perturbation theory.

*How are baryons described?* Cf: The Skyrme model.

In this talk, I show the effective nucleon mass (in a certain situation)

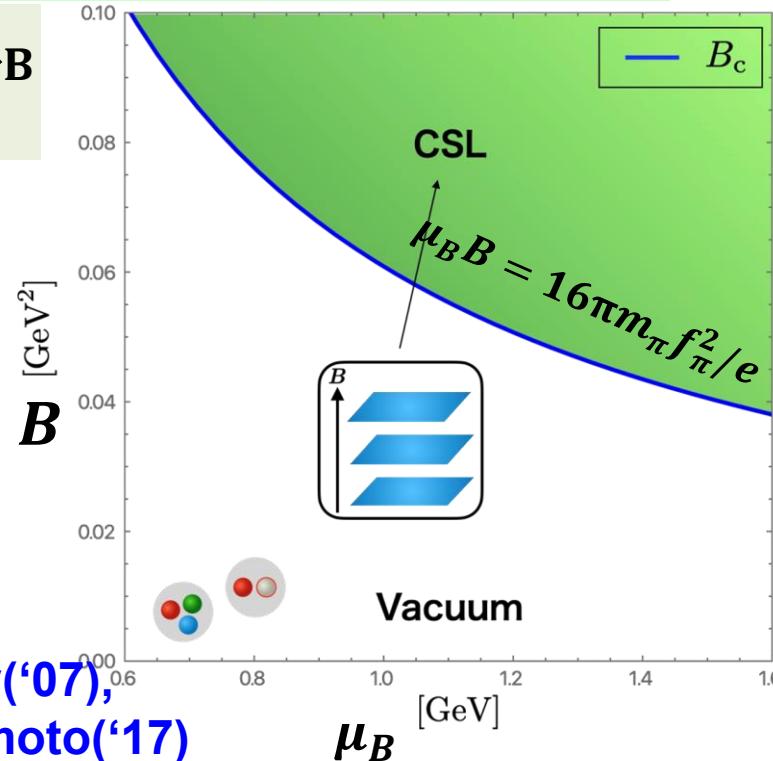

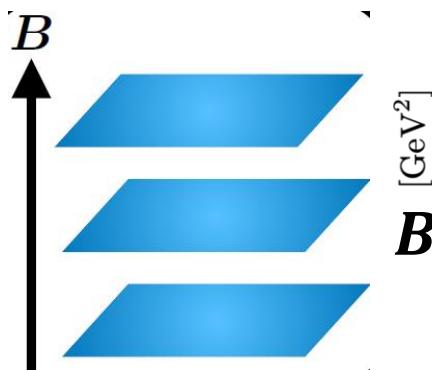

$$"m_N" = \frac{16\pi f_\pi^2}{3m_\pi} \sim 1.03 \text{ GeV}$$

Vacuum values  
 $f_\pi \sim 93$  MeV,  
 $m_\pi \sim 140$  MeV

## Domain-Wall Skyrmion Crystal (DW-SkX) phase

@  $\mu_B \geq 1.03$  GeV

Walls & Skyrmioms  
carry baryon #

## Remarkable points of our work

- (1) We show this in the **chiral perturbation theory**  
@ the leading order  $\mathcal{O}(p^2)$  ***without higher derivative***  
**(Skyrme term.**) Thus, it is model independent.  
(Skyrmions are stable without the Skyrme term.)
- (2) The critical  $\mu_B$  coincides with the instability of CSL  
via **charged pion condensation** (Brauner-Yamamoto '17).
- (3) The  $\mu_B$  corresponds to the **nuclear saturation density**

$$\mu_B \geq \mu_c = \frac{16\pi f_\pi^2}{3m_\pi} \sim 1.03 \text{ GeV}$$

remarkably, written in terms of **only pion** information.

# Chiral sine-Gordon model in QCD [Son-Stephanov('07)]

SU(2) Nambu-Goldstone fields       $\Sigma = \exp\left(\frac{i\sigma^a \pi^a}{f_\pi}\right) = \exp(i\sigma^a \chi_a)$

## Chiral Lagrangian with Wess-Zumino-Witten(WZW) term

$$\mathcal{L}_{\chi\text{PT}} = \frac{f_\pi^2}{4} \text{Tr} [D_\mu \Sigma D^\mu \Sigma^\dagger + m_\pi^2 (\Sigma + \Sigma^\dagger)] + \mathcal{L}_{\text{WZW}}$$

$$\mathcal{L}_{\text{WZW}} = - \left( A_\mu^B + \frac{1}{2} A_\mu^{\text{EM}} \right) j_B^\mu \quad D_\mu \Sigma \equiv \partial_\mu \Sigma + ie A_\mu [Q, \Sigma], \quad Q = \frac{1}{6} \mathbf{1} + \frac{1}{2} \tau_3$$

$$j_B^\mu = -\frac{1}{24\pi^2} \epsilon^{\mu\nu\alpha\beta} \left\{ \text{Tr} L_\nu L_\alpha L_\beta - \frac{3}{2} i \partial_\nu (A_\alpha \sigma^3 (L_\beta + R_\beta)) \right\}$$

A constant magnetic field  $B$

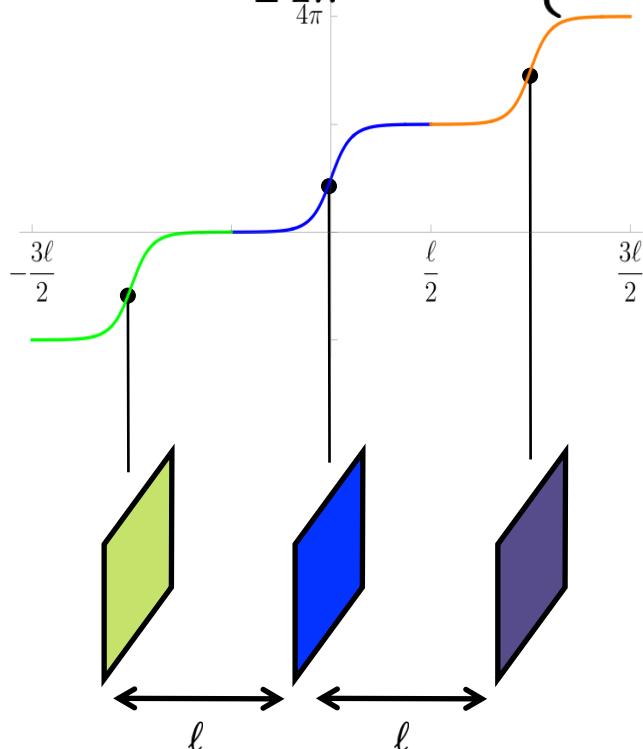

$$A_\mu^B j_B^\mu = \mu_B j_B^{\mu=0}$$

A baryon chemical potential  $A_\mu^B = (\mu_B, \vec{0})$   
 Ignoring charged pions  $\chi_{1,2} = 0$

Baryon#  
density

# Previous works assume 1D structure

$$\mu_B j_B^\mu = -\frac{\mu_B}{24\pi^2} \epsilon^{\mu\nu\alpha\beta} \left\{ \text{Tr} L_\nu L_\alpha L_\beta - \frac{3}{2} i \partial_\nu (A_\alpha \sigma^3 (L_\beta + R_\beta)) \right\}$$

In 1D, this part gives

$$\sim \mu_B B \partial_z \chi_3 \quad (\chi_{1,2} = 0)$$

↑  
magnetic field

chemical potential  
(finite density)

Chiral soliton lattices  
Son & Stephanov('07),  
Brauner & Yamamoto('17)

Ignoring charged pions      (chiral sine-Gordon model)  
 = Sine-Gordon model + topological term

$$\mathcal{L} = \frac{f_\pi^2}{2} (\partial_\mu \chi_3)^2 - f_\pi^2 m_\pi^2 (1 - \cos \chi_3) + \boxed{\frac{e\mu_B}{4\pi^2} B \cdot \nabla \chi_3}$$

topological term

Cf. The same model appears in chiral magnets in which  
 a topological term is the Dzyaloshinskii–Moriya interaction.

The condition that domain walls appear in the g.s.

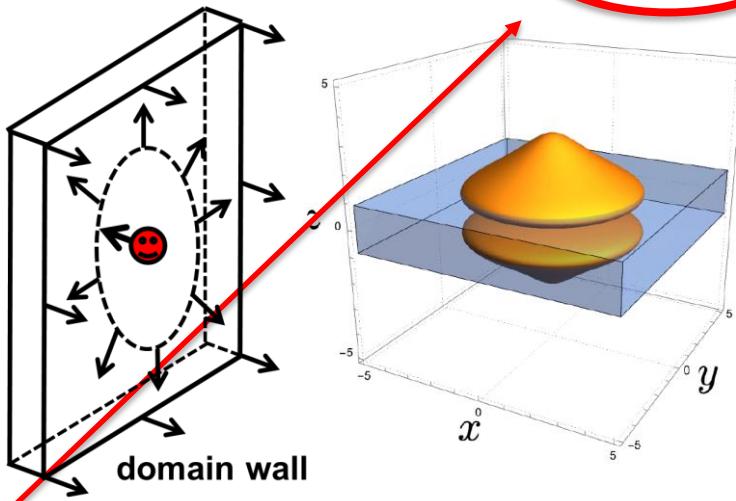

$$E = 8m_\pi f_\pi^2 \left[ -\frac{e\mu_B B}{2\pi} \right] \leq 0 ! \Leftrightarrow \boxed{\mu_B B = 16\pi m_\pi f_\pi^2 / e}$$

DW tension of  
 a single soliton      Topological term

$$\chi_3 = 4 \tan^{-1} e^{m_\pi(z-Z)}$$

# Previous works assume 1D structure

$$\mu_B j_B^\mu = -\frac{\mu_B}{24\pi^2} \epsilon^{\mu\nu\alpha\beta} \left\{ \text{Tr} L_\nu L_\alpha L_\beta - \frac{3}{2} i \partial_\nu (A_\alpha \sigma^3 (L_\beta + R_\beta)) \right\}$$

In 1D, this part gives

$$\sim \mu_B B \partial_z \chi_3 \quad (\chi_{1,2} = 0)$$

↑  
magnetic field

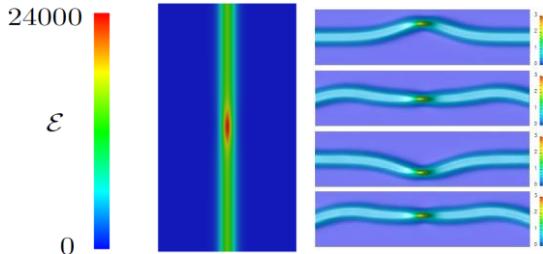

chemical potential  
(finite density)

$$\chi_{1,2} \neq 0$$

Due to this term ( $\neq 0$  with charged pions) in full 3D,  
**DW Skyrmion lattices are true ground state!**  
(in certain parameter region).

## **§ 2 Derivation & Some more details**

- (1) Considering a single soliton**
- (2) Constructing DW world-volume effective theory**
- (3) Constructing lumps (baby Skyrmions)**

## Technical details

### (1) Considering a single soliton

$$\chi_3^{\text{single}} = 4 \tan^{-1} e^{m_\pi(z-Z)} \quad \Sigma_0 = e^{i\tau_3 \chi_3}$$

More general solution with  $S^2$  moduli (collective coordinates)

$$\begin{aligned} \Sigma &= g \Sigma_0 g^\dagger \quad g \in SU(2)_V \\ &= [\mathbf{1}_2 + (u^2 - 1)\phi\phi^\dagger] u^{-1} \quad u \equiv e^{i\chi_3^{\text{single}}} \end{aligned}$$

**Non-Abelian soliton**     $\phi \in \mathbb{C}^2, \quad \phi^+ \phi = \mathbf{1}$   
 $g\sigma_3 g^+ = 2\phi\phi^+ - \mathbf{1}_2$

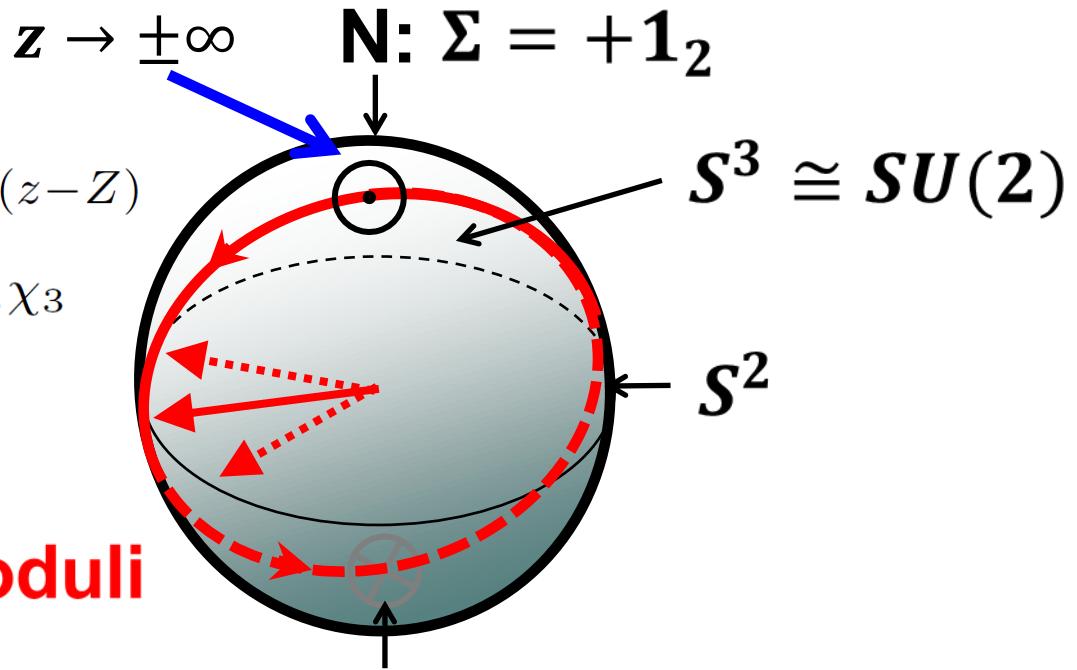

Cf:  $\eta$ -solitons under rotation are also non-Abelian

Eto, Nishimura & MN, JHEP 08 (2022) 305, [2112.01381](#) [hep-ph]

$$\chi_3^{\text{single}} = 4 \tan^{-1} e^{m_\pi(z-Z)}$$

$$\Sigma_0 = e^{i\tau_3 \chi_3}$$

Charged pions  
 $S^2$  moduli

Cf: Domain wall with  $S^2$  moduli

Losev, Shifman & Vainshtein ('02)

Ritz, Shifman & Vainshtein ('04)

## (2) Constructing DW world-volume effective theory via the moduli (Manton) approximation

### (a) Promote moduli to fields on D=2+1 worldvolume

$$\phi \rightarrow \phi(x^\alpha), \quad (\alpha = 0, 1, 2)$$

Translational and orientational moduli

### (b) Integrate over codimension $x^3$

→ D=2+1 worldvolume effective theory

\*\* A well-defined & established method to construct e.g. monopole or instanton moduli space.

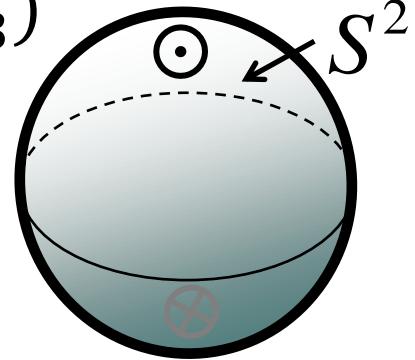

## A review: O(3) nonlinear sigma model

$$\mathcal{L} = \frac{1}{2} \partial^\mu n \partial_\mu n$$

$$n = (n_1, n_2, n_3)$$

$$n^2 = 1$$

Target space  $S^2 = \frac{SO(3)}{SO(2)}$

$$\mathbb{C}P^1 = \frac{SU(2)}{U(1)} \cong S^2$$

## $\mathbb{C}P^1$ model

$$\mathcal{L} = \partial^\mu \phi^+ \partial_\mu \phi + \phi^+ \partial^\mu \phi \phi^+ \partial_\mu \phi$$

$$n \equiv \phi^\dagger \sigma \phi \quad \phi \sim \exp(ia)\phi, \quad |\phi|^2 = 1 \quad \phi \in \mathbb{C}^2$$

## (2) Constructing DW world-volume effective theory via the moduli (Manton) approximation

$$\mathcal{L}_{\text{DW}} = -8m_\pi f_\pi^2 + \frac{e\mu_B B}{2\pi} + \mathcal{L}_{\text{norm}} + \mathcal{L}_{\text{WZW}}$$

DW tension      Topological  
 term for DW

**Gauged  $\mathbb{C}P^1$  model**

$$\mathcal{L}_{\text{norm}} = \frac{16f_\pi^2}{3m_\pi} [(\phi^\dagger D_\alpha \phi)^2 + D_\alpha \phi^\dagger D^\alpha \phi] \quad D_\alpha \phi = (\partial_\alpha + i\frac{e}{2}\tau_3 A_\alpha) \phi$$

$$\mathcal{L}_{\text{WZW}} = 2\mu_B q + \frac{e\mu_B}{2\pi} \epsilon^{03jk} \partial_j [A_k (1 - n_3)]$$

Background gauge field at  $\mathcal{O}(p^2)$

$$n_a = \phi^\dagger \tau_a \phi$$

**Topological term for 2D (baby) Skyrmions**  $\pi_2(S^2) \cong \mathbb{Z}$

$$q \equiv -\frac{i}{2\pi} \epsilon^{ij} \partial_i \phi^\dagger \partial_j \phi = \frac{1}{8\pi} \epsilon^{ij} \mathbf{n} \cdot (\partial_i \mathbf{n} \times \partial_j \mathbf{n})$$

## Remark: chiral perturbation theory

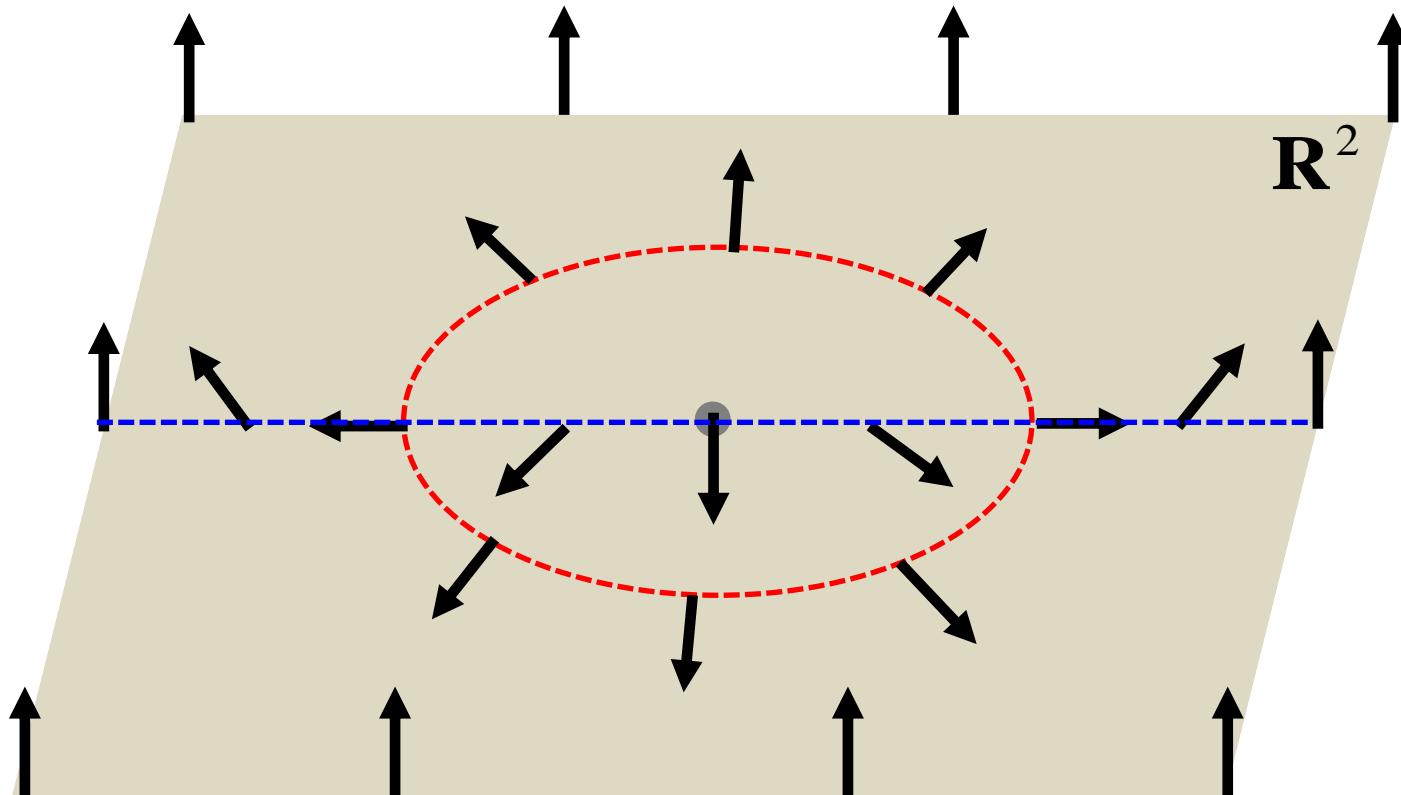

$$\partial_\mu, m_\pi, A_\mu = \mathcal{O}(p^1), \quad A_\mu^B = \mathcal{O}(p^{-1})$$

$$F_{\mu\nu}^2 \in \mathcal{O}(p^4)$$

Gauge field is **nondynamical** at the leading  $\mathcal{O}(p^2)$

# 2D (baby) Skyrmion (or lump)

$$\pi_2(S^2) \cong \mathbb{Z}$$

### (3) Constructing lumps (baby Skyrmions).

$$\mathcal{H}_{\text{DW}} = \frac{4f_\pi^2}{3m_\pi} (\partial_i \mathbf{n})^2 - 2\mu_B q - \frac{e\mu_B}{2\pi} \epsilon^{03jk} \partial_j [A_k (1 - n_3)]$$

$\uparrow$   
 $\partial_i \mathbf{n} \cdot \partial_i \mathbf{n} = \frac{1}{2} \underbrace{(\partial_i \mathbf{n} \pm \epsilon_{ij} \mathbf{n} \times \partial_j \mathbf{n})^2}_{= 0} \pm 8\pi q$

Bogomol'nyi bound

**BPS** equation (the same as usual)

$$E_{\text{DW}} \geq \underbrace{\frac{32f_\pi^2 \pi |k|}{3m_\pi}}_{\text{Can become } < 0 ?} - 2\mu_B k + \frac{e\mu_B B}{4\pi} \oint dS_i x^i (n_3 - 1)$$

$\rightarrow$  nontrivial constraint

$$k = \int d^2x q \in \mathbb{Z}$$

lump number

## BPS lumps (the same with Belavin &Polyakov)

$k$  lump solutions

$$n_3 = \frac{1 - |f|^2}{1 + |f|^2}, \quad f = \frac{b_{k-1}w^{k-1} + \cdots + b_0}{w^k + a_{k-1}w^{k-1} + \cdots + a_0}$$

Baryons appear pairwise

$$N_B = \int d^3x \mathcal{B} = 2 \int d^2x q = 2k$$

$\pi_2(S^2) \cong \mathbb{Z}$  on a wall  
(in D=2+1)

$\pi_3(S^3) \cong \mathbb{Z}$  in the bulk  
(in D=3+1)

However, it's not the end of the story.

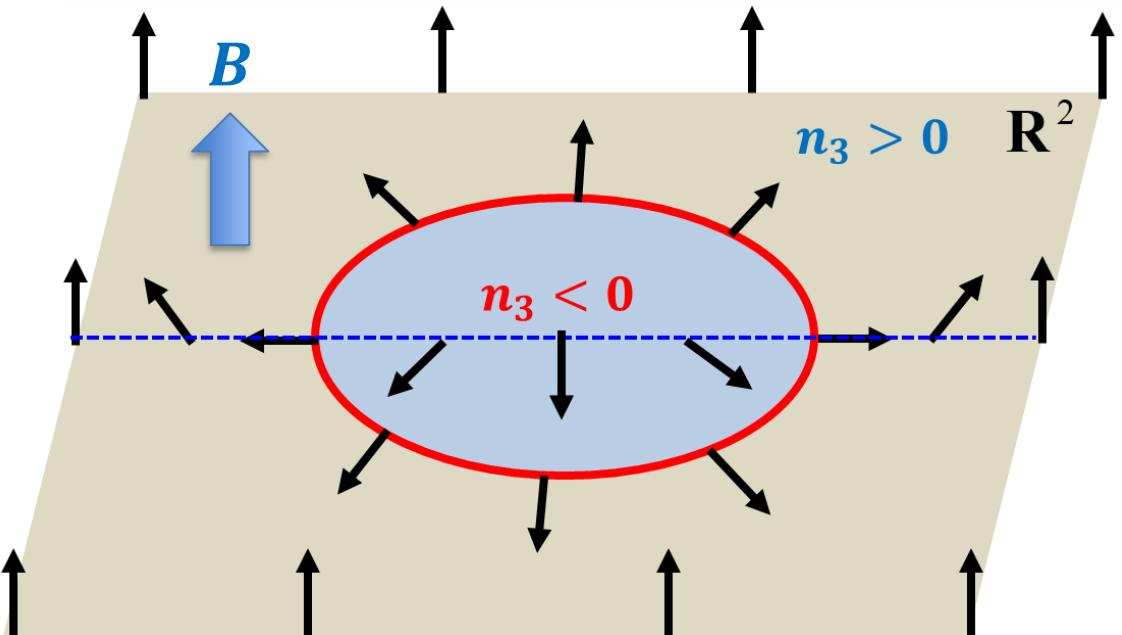

There are two nontrivial constraints as follows.

# superconducting ring

## Area quantization

$$n_1 + in_2 \rightarrow e^{-i\lambda}(n_1 + in_2)$$
$$n_3 \text{ is neutral in } U(1)_{EM}$$

$$BS_D = \int_D d^2x B = \oint_C dx^i A_i = \frac{1}{e} \oint_C dx^i \partial_i \psi = \frac{2\pi k}{e}$$

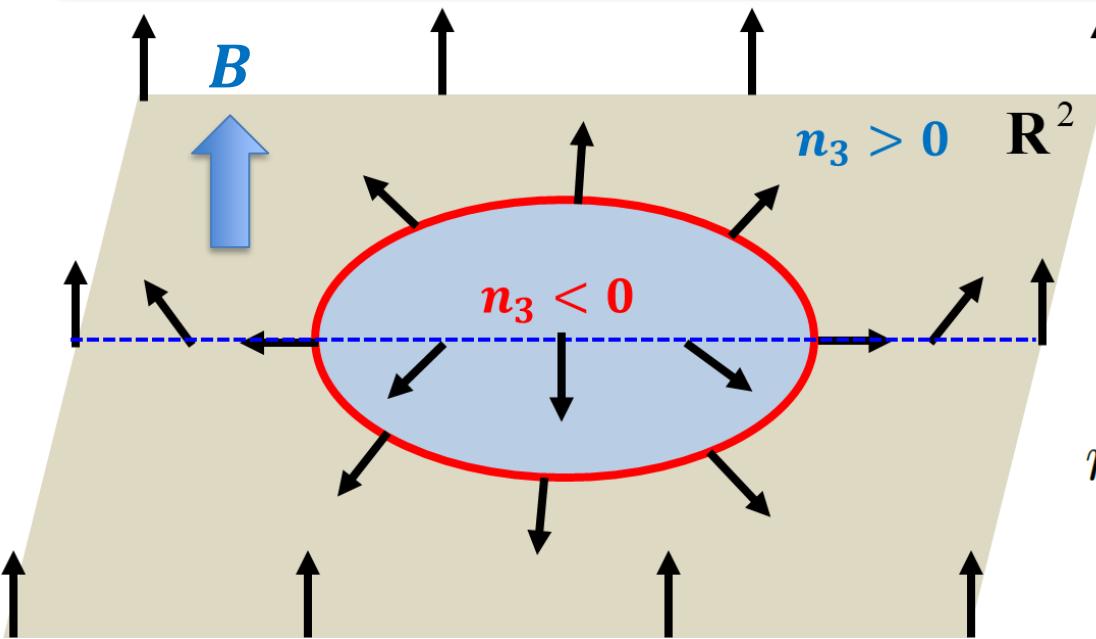

$$n_1 + in_2 = e^{i\psi}$$
$$|D_\alpha(n_1 + in_2)|^2 = 0$$
$$\partial_\alpha \psi = eA_\alpha$$

# superconducting ring

## Area quantization

$$n_1 + i n_2 \rightarrow e^{-i\lambda} (n_1 + i n_2)$$
$$n_3 \text{ is neutral in } U(1)_{EM}$$

$$BS_D = \int_D d^2x B = \oint_C dx^i A_i = \frac{1}{e} \oint_C dx^i \partial_i \psi = \frac{2\pi k}{e}$$

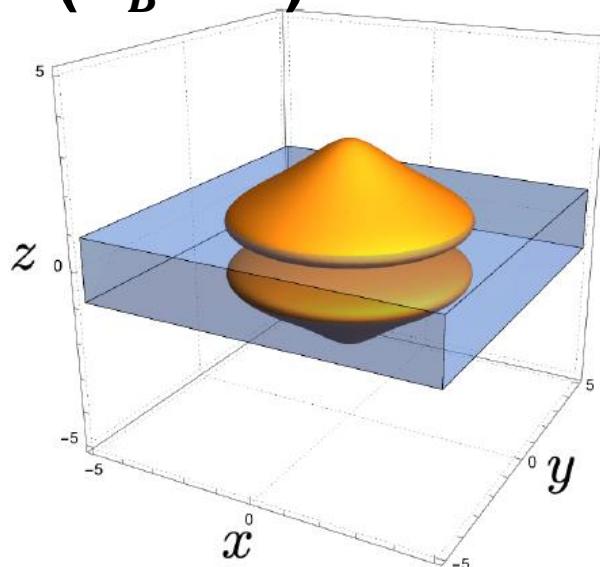

$$k = 1 \quad f = b_0/w$$

$$n_3 = \frac{|w|^2 - |b_0|^2}{|w|^2 + |b_0|^2}$$

$$n_3 = 0 @ |w| = |b_0|$$

$$b_0 = 4/eB$$

# $k = 1$ ( $N_B = 2$ ) domain-wall Skyrmion

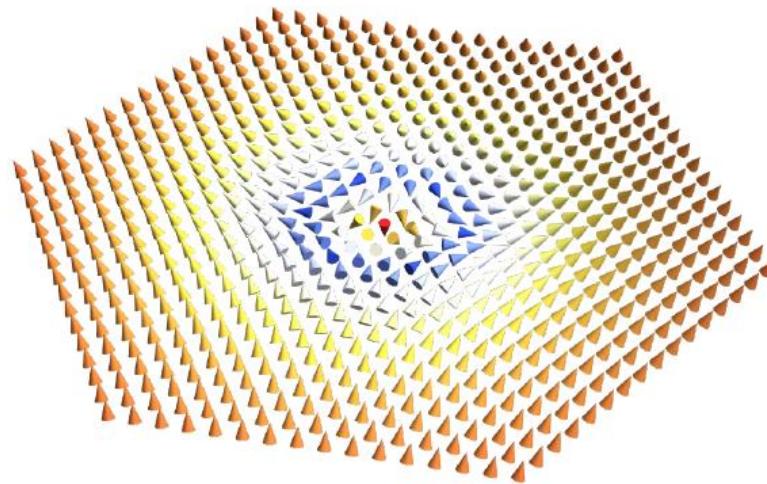

Iso-baryon number density surface
