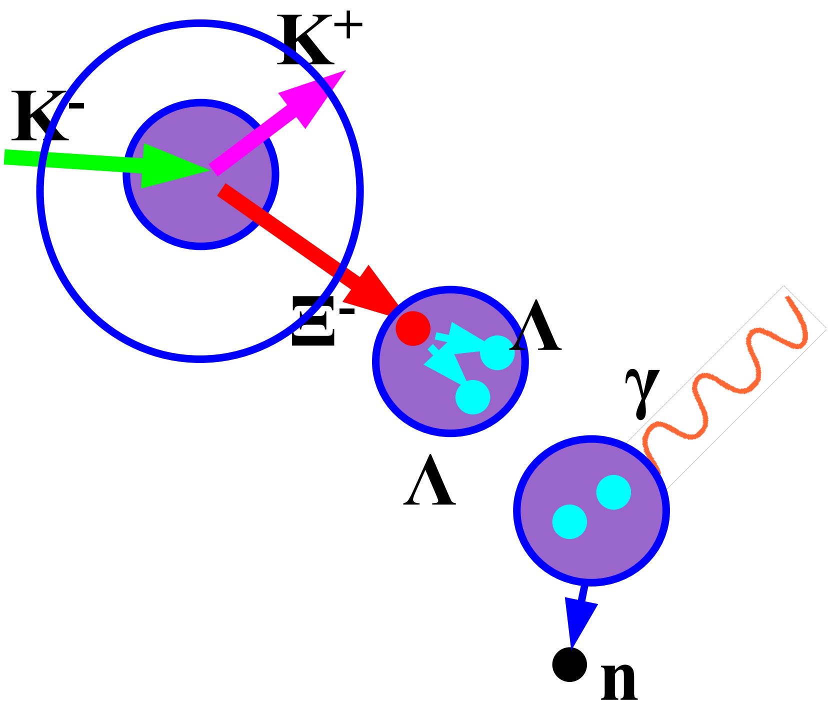
Ξ hypernuclear structure study in coupled channel AMD



In producing Ξ hypernuclei, we need to know the excited levels and the transition rate

Antisymmetrized Molecular Dynamics (AMD)

- Microscopic Model for *Structure and Reaction* Studies

  Ono, Horiuchi, Maruyama, AO, 1992 / Kanada-En'yo, Horiuchi, 1995

  - Slater determinant of Gaussian wave packets
  - Capable of describing Shell / Cluster states
  - Variation of parameters determines the shape of nuclei
  - Good description of transition matrix element (B(E2), ..)
  - *Problems in structure studies:*

    High CPU cost for heavy nuclei → Wait for Faster CPU

    Nodes are generated by Antisym. → No Node for one particle

    → Multigauss AMD (*Dote,Akaishi,Horiuchi,Yamazaki, 2004*)

    Inverse matrix elements of s.p. overlap → No particle mixing

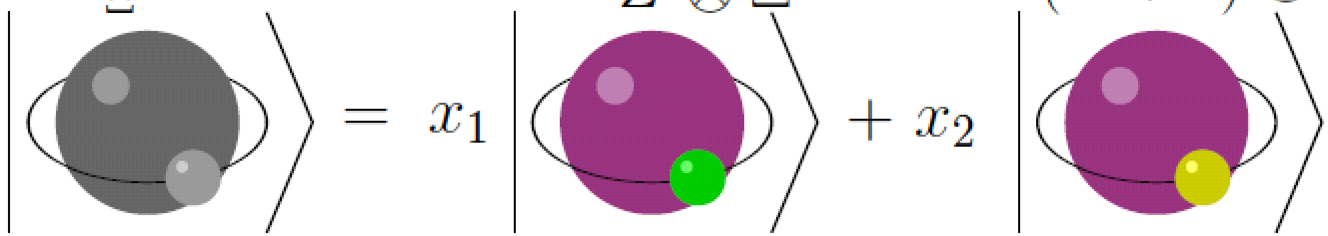
    → CoFactor rather than Inverse Matrix (*This work*)

Coupled Channel AMD (ccAMD)

- **Wave function = superposition of Channel AMD w.f.**

$$|\Psi\rangle = \sum_a x_a |\Phi^a\rangle \qquad (a : \text{channel}) \qquad |\Phi^a\rangle = \frac{1}{\sqrt{A!}} \det\left[|\varphi_j^a(i)\rangle\right]$$

$$ {}^{A}_{\Xi}Z \qquad\qquad {}^{(A-1)}Z \otimes \Xi^0 \qquad\qquad {}^{(A-1)}(Z+1) \otimes \Xi^- $$



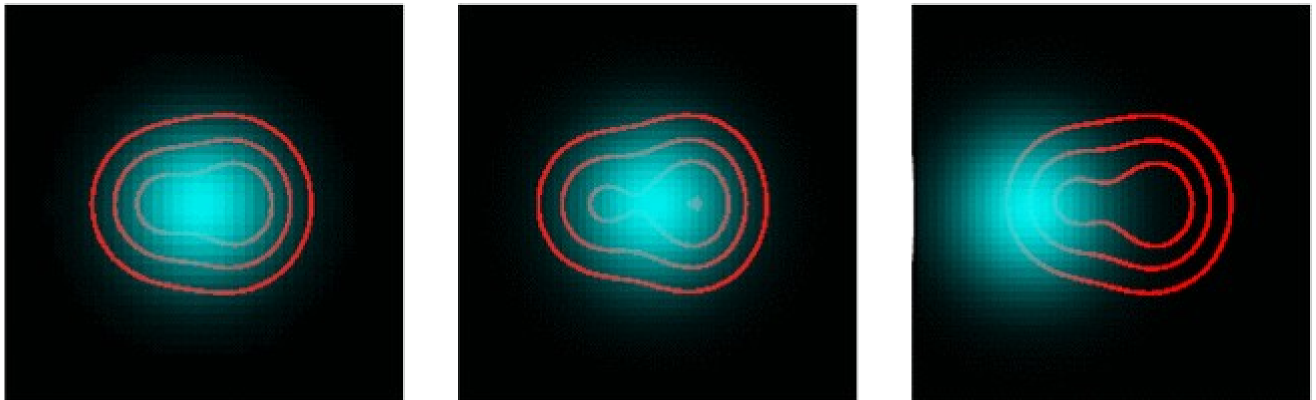
- **Hamiltonian =T + V$_{NN}$ + V$_{YN}$ + Mass diff.**

$$\hat{H} = \hat{T} - \hat{T}_{\rm cm} + \hat{V} + \Delta mc^2$$

  - **VNN : Brink-Boeker-Okabe (BBO1)**
  - **VYN : G-matrix of Nijmegen Extended Soft Core (ESC04d, *Rijken, Yamamoto, 2006*)**
    Consistency VYN (ρ) ↔ ρ =< ρ> (Dote-Akaishi prescription)

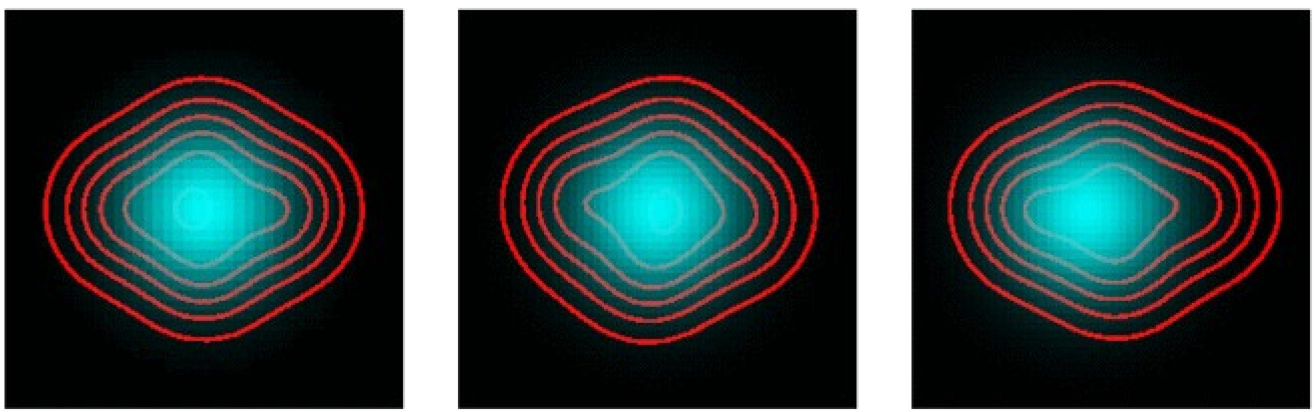
Density Distribution

- $^{12}_{\Xi}Be$



Intrinsic π=-1 π =+1

- $^{28}_{\Xi}Mg$

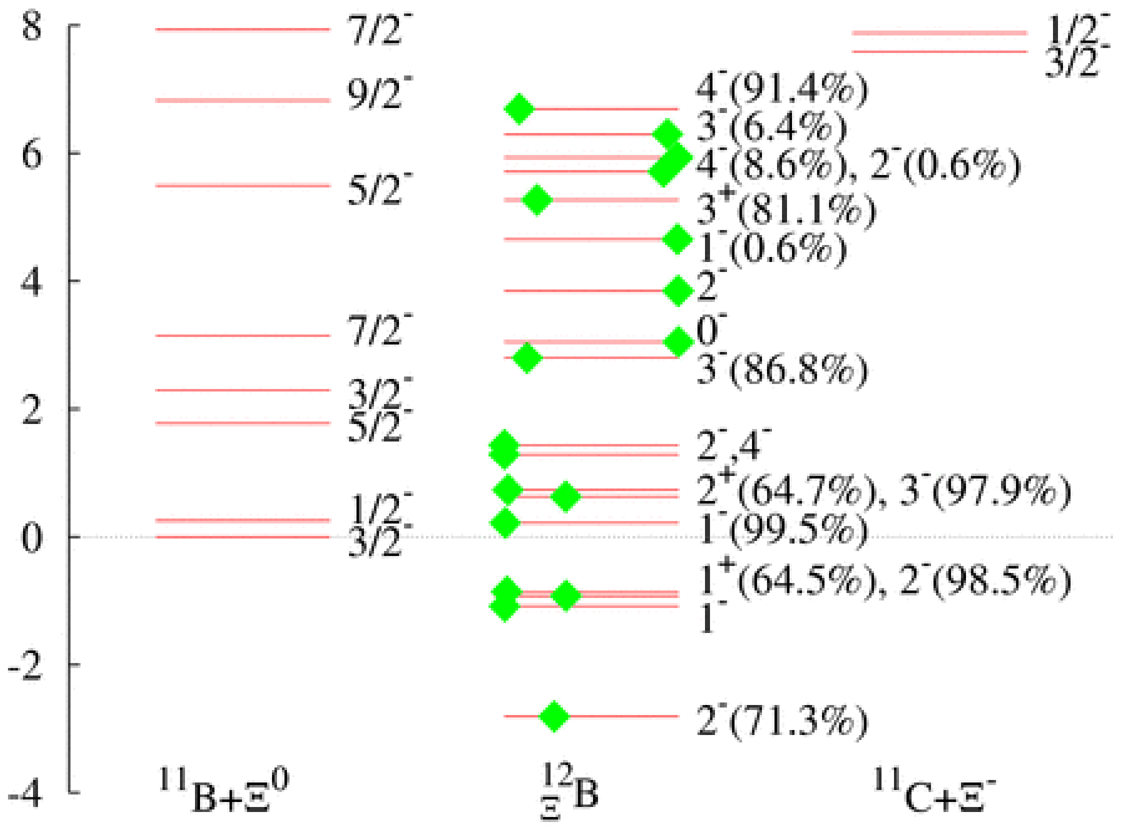


Intrinsic π=+1 π =-1

- **Nuclei are not necessarily spherical !**
- **Core and Ξ Parities are mixed !**

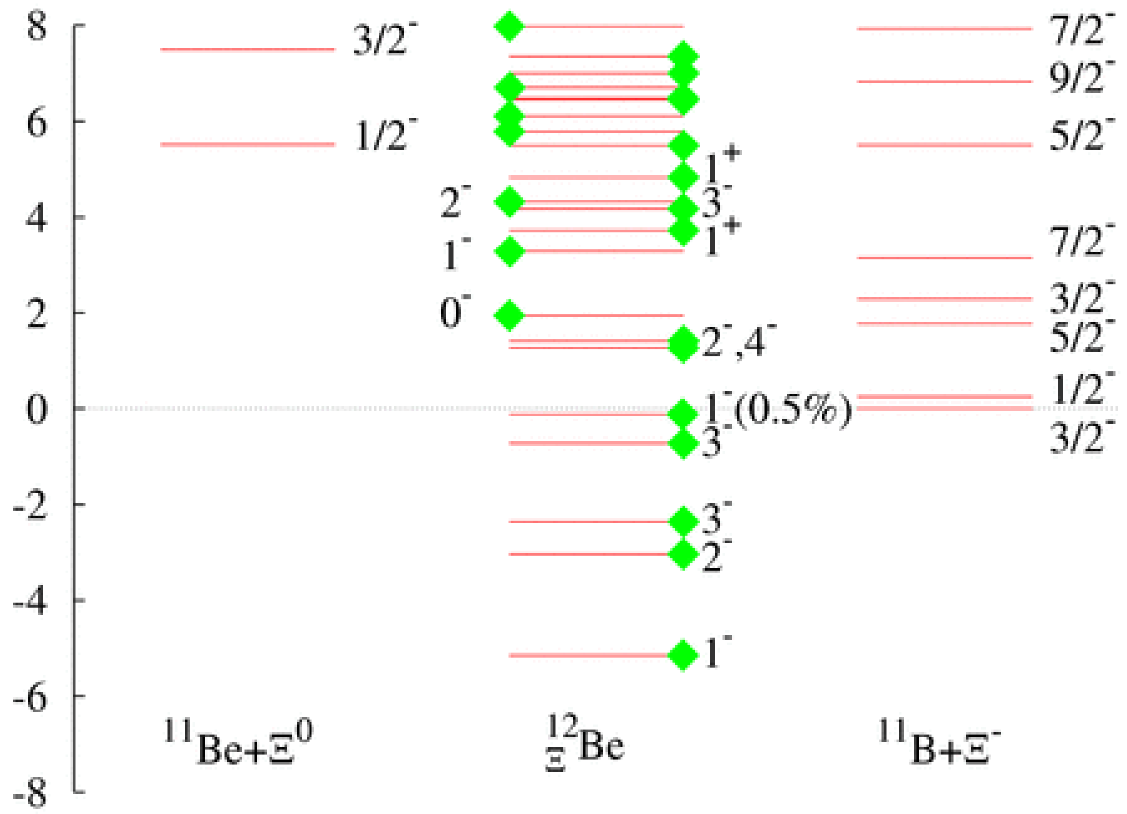
Level Structure: $^{12}_{\Xi}B$ (Coherent mixing ?)

- $^{12}C(K^-,K^0)^{12}_{\Xi}B$, $^{12}_{\Xi}B = (^{11}B+\Xi^0)+(^{11}C+\Xi^-)$
  - (Mirror Core)$\otimes\Xi$, T=0, 1 $\rightarrow \Xi^0 : \Xi^- = 1:1$ without isospin breaking
  - Mass diff. ($M(\Xi^-) \sim M(\Xi^0)$+7 MeV) & Coulomb break isospin sym. $\rightarrow$ We need Charge base !



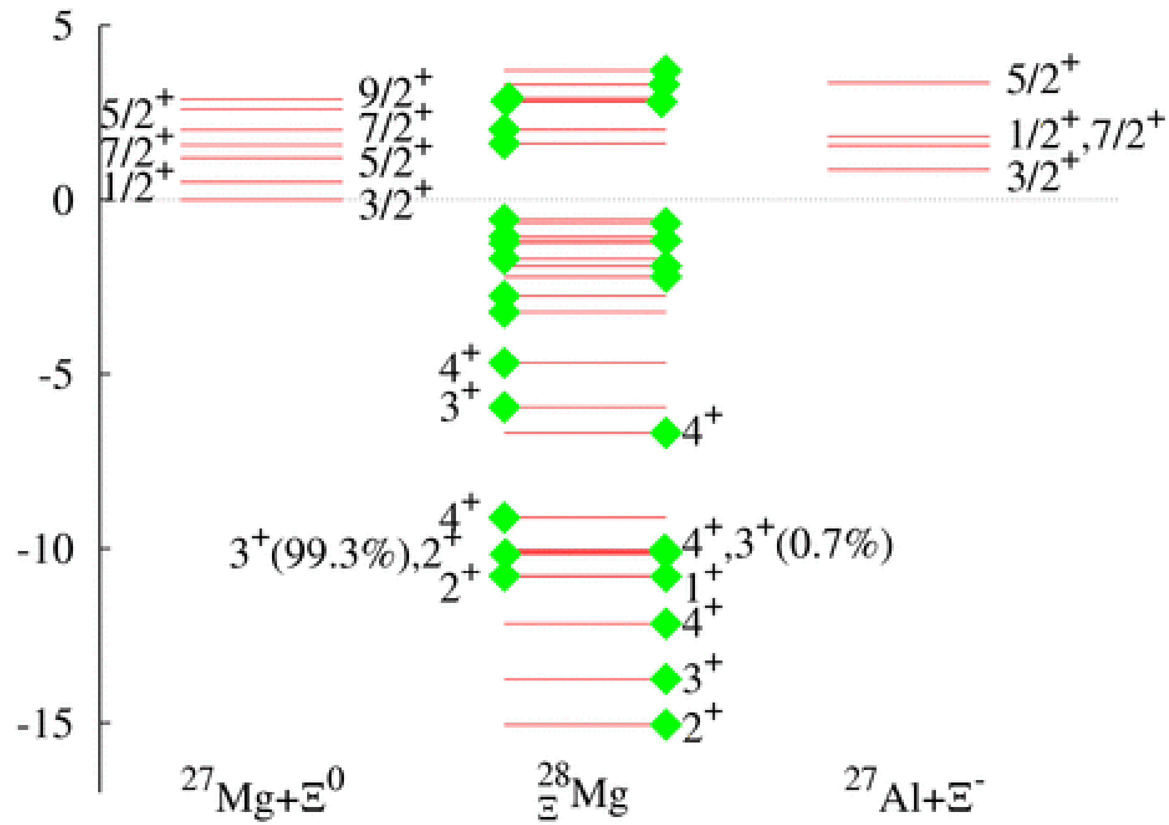
Level Structure: $^{12}{}_{\Xi}$Be (Day-One Experiment Nucleus)

- ^{12}C(K$^-$,K$^+$)$^{12}{}_{\Xi}$Be, $^{12}{}_{\Xi}$Be =(^{11}Be(T=3/2)+Ξ^0)+(^{11}B(T=1/2)+Ξ^-)
  - "Mass diff. of Core > Mass diff. of Ξ" + "Core T diff."
    → Almost No Coupling Effects
    → Single Channel (potential) description would be good enough !

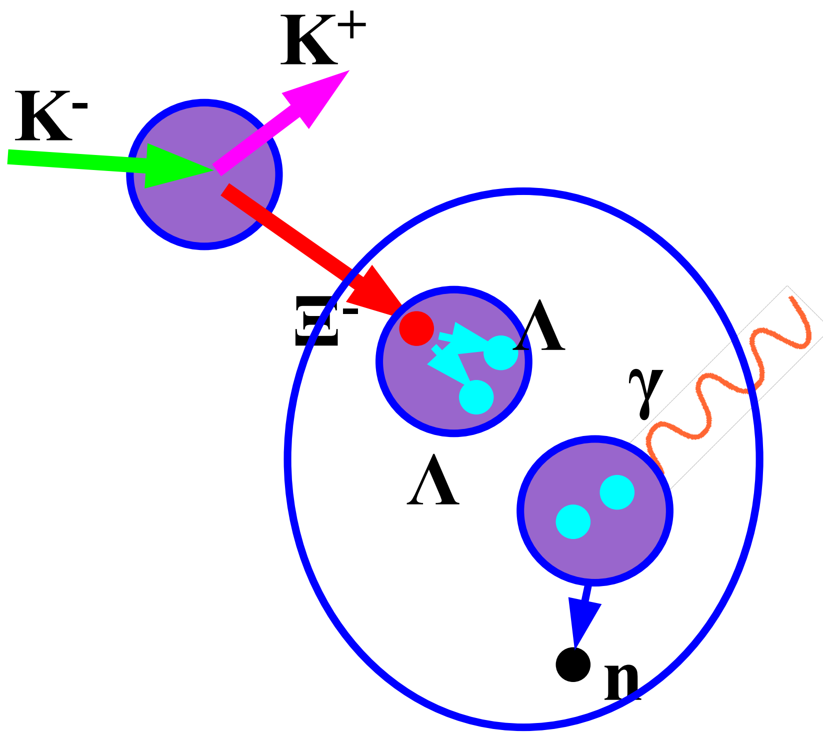


Level Structure: $^{28}_{\Xi}$Mg (Day-Two Experiment ?)

- ^{28}Si(K$^-$,K$^+$)$^{28}_{\Xi}$Mg, $^{28}_{\Xi}$Mg =(^{27}Mg(T=3/2)+Ξ^0)+(^{27}Al(T=1/2)+Ξ^-)
  - "Masses of Core+Ξ" are Comparable, but Core T are different.
  - Almost no mixture of Ξ^- and Ξ^0 channels
    → Ξ^- states will be selectively populated in (K$^-$,K$^+$) reaction



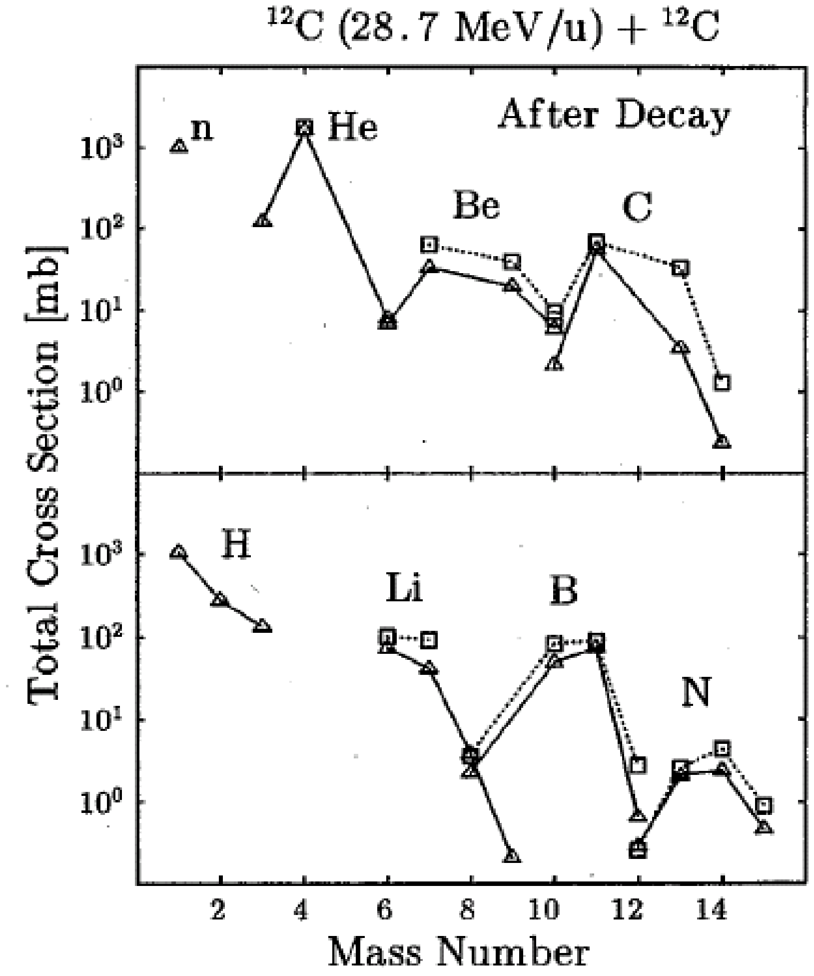
Statistical decay model study of Ξ hypernuclei



For double Λ hyp. nucl. (DΛHN)
γ ray spectroscopy,
it is necessary to know
which DΛHN are produced !

Transport + Statistical Decay Model (1)

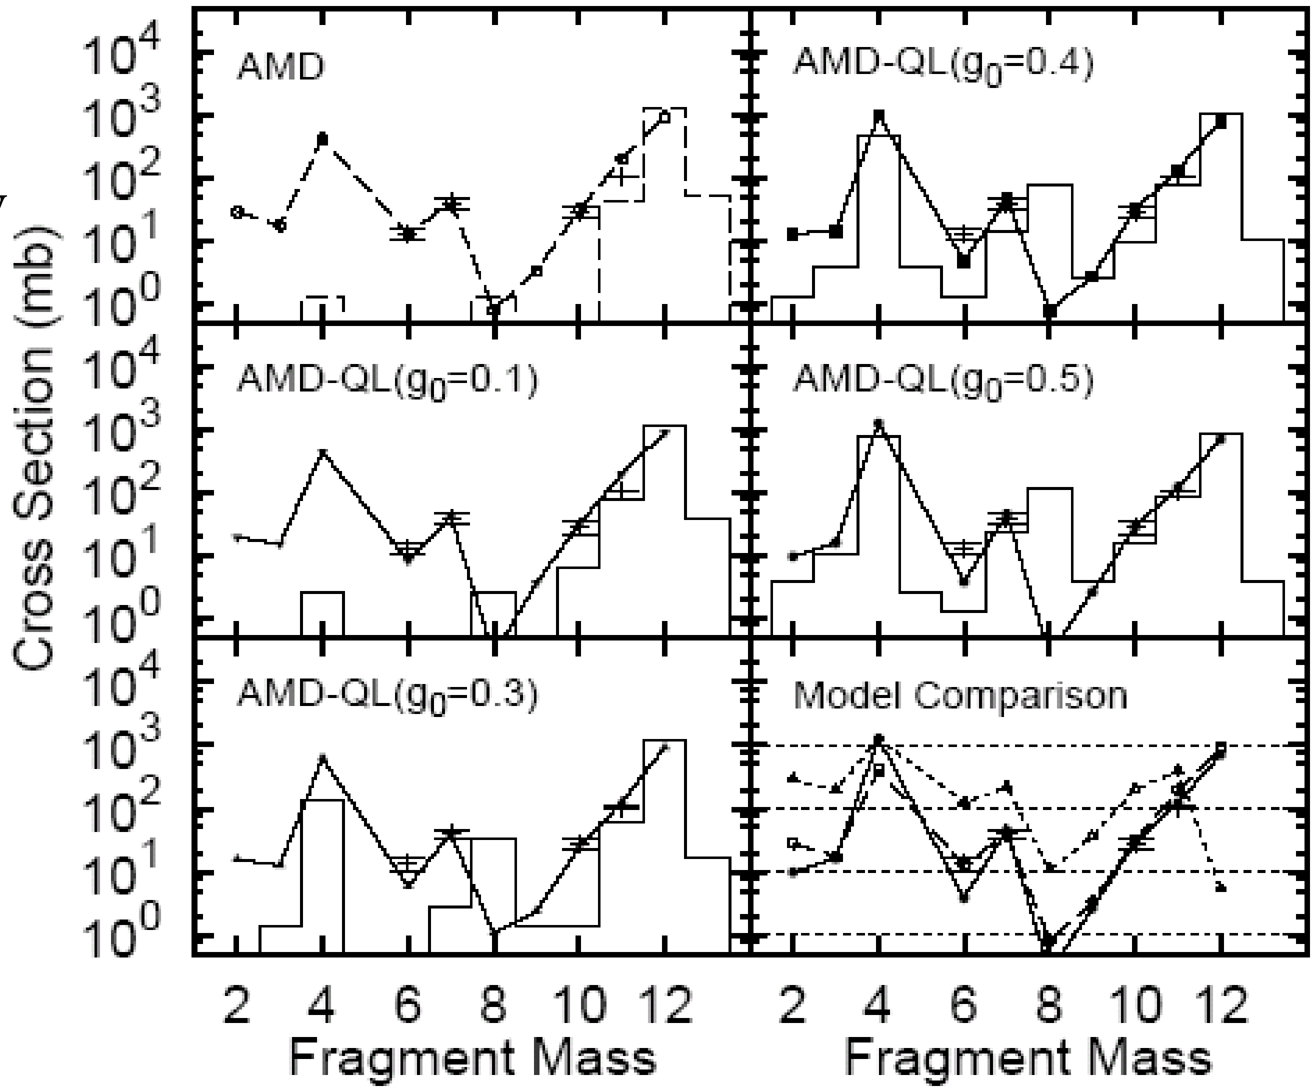
- **Multistep evap. of nucleons and α from Excited Nuclei (Statistical Cascade Decay Process)**
  - **Established decay process**
  - **Combined with transport model, Cascade gives reliable results !**
  - **AMD + Cascade (Δ)**
    → Describes frag. form. data (□) within a factor of two !



Ono, Horiuchi, Maruyama, AO, PRL and PTP, 1992.

Transport + Statistical Decay Model (2)

- **AMD-QL (with Quantum Statistical Fluctuation) + Cascade decay**
  - **Incl. quantum fluc. simulats stat. decay dynamically.**



p(45 MeV)+^{12}C *Hirata, Nara, AO, Harada, Randrup, 1999*

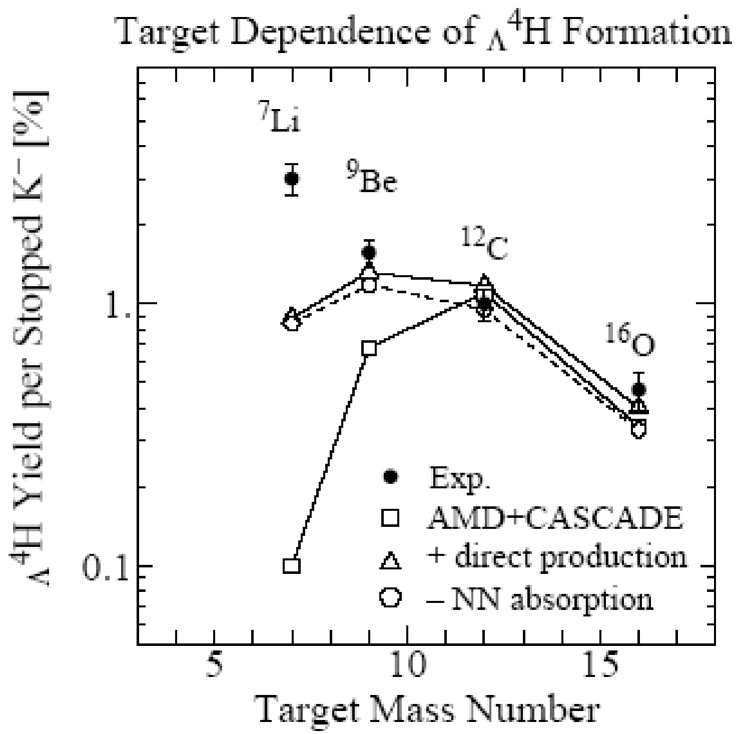
Hyperfragment Formation

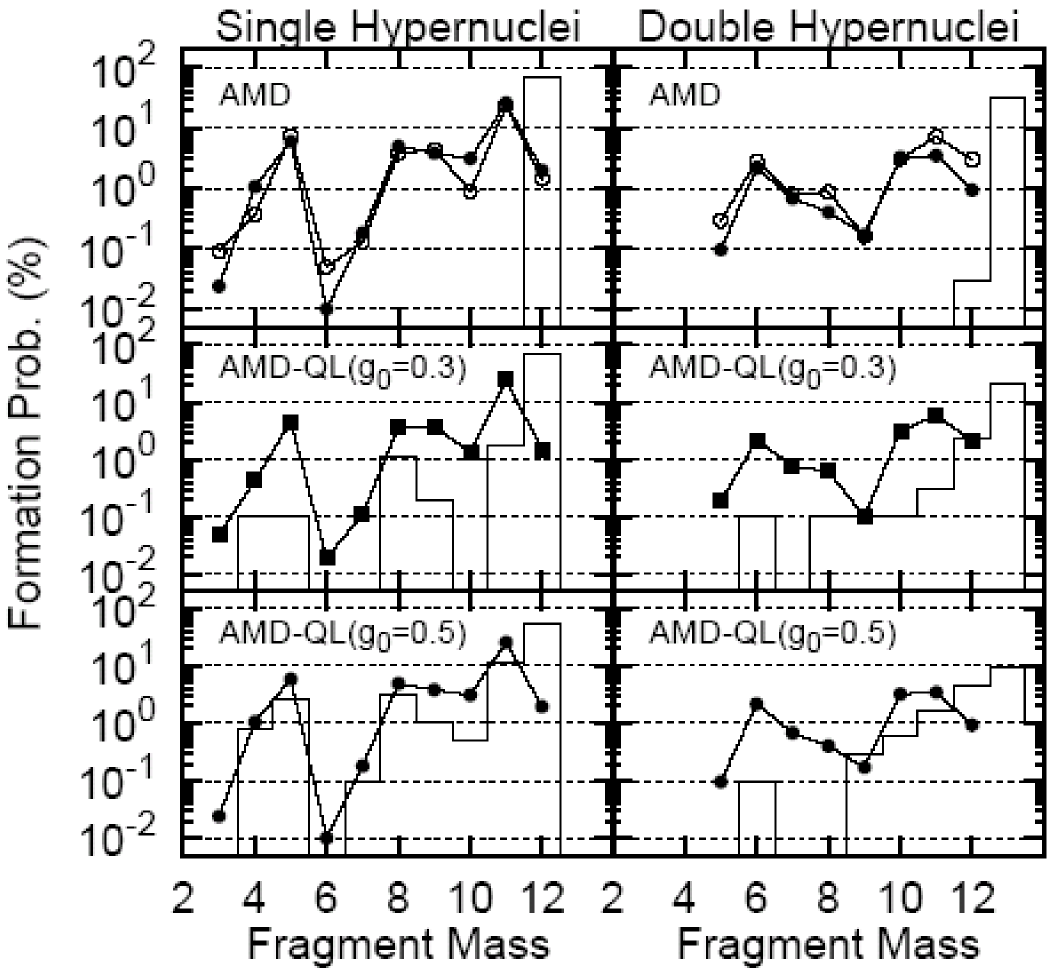
- **Stopped K- + (Li, C, O) → $^{4}_{\Lambda}$H**

  Tamura et al. 1989 / Nara,AO,Harada, 1995

- **Stopped Ξ^- + ^{12}C → Double, Twin, Single hypernuclei**

  KEK-E176 / Hirata et al. 1999





Double Hypernuclear Formation from Stopped Ξ^-

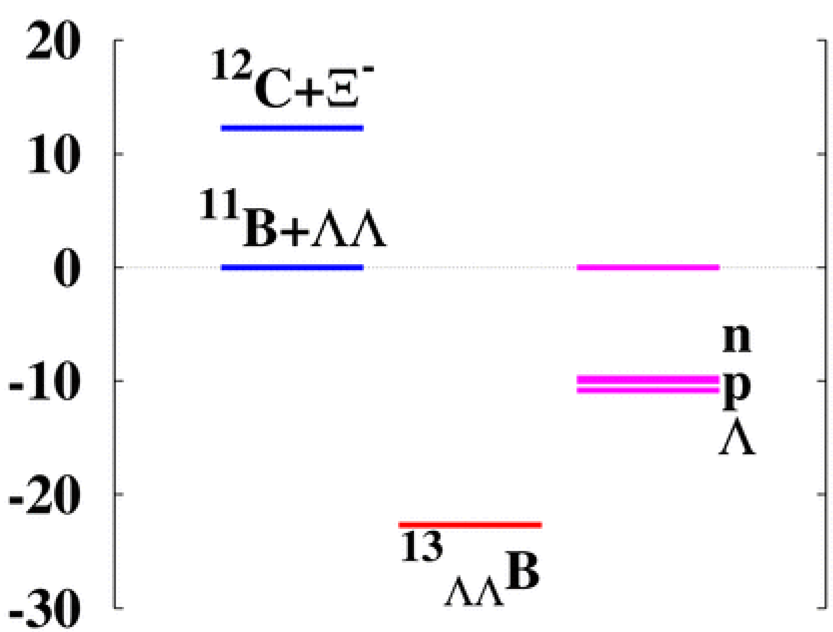
- **Theoretical Models**
  - **AMD/AMD-QL + Cascade (*Hirata et al., 1999*)**
  - **Direct Reaction (*Yamada, Ikeda, 1997*)**
    Two-Cluster Res. dominance in Twin hypernuclear form.
  - **Statistical Decay (*Yamamoto, Sano, Wakai, 1994*)**
    Canonical dist. model (~ Copenhagen model, *c.f. Botvina's talk*)

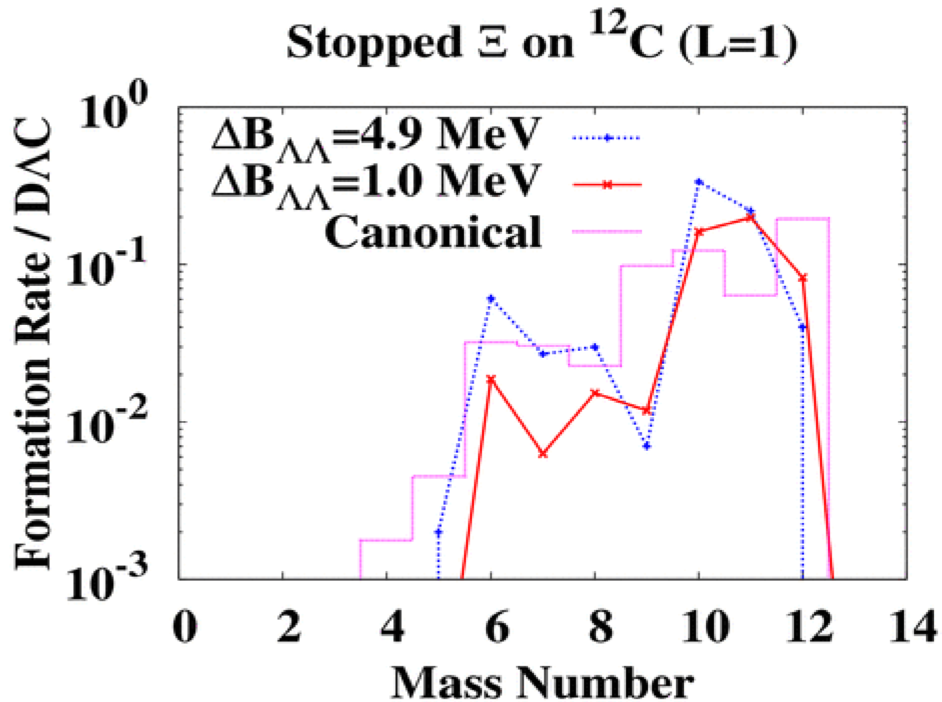
→ Dominant Double Λ hypernuclear formation Prob.
= (Double Λ Compound Nucleus (DΛC) formation prob. w/o quantum fluc.)
× (Double Λ hypernucleus (DΛHN) survival prob.)

Let's evaluate DΛHN survival prob. in Cascade Decay Model in Stopped Ξ^- on ^{56}Fe

Stopped Ξ^- on ^{12}C

- **Double Λ Compound Nucleus (DΛC) Formation Prob.**
  ~ 30 % (AMD), 16 %, (AMD-QL (with quantum fluc.))
- **Double Λ Hyp. Nucl. (DΛHN) survival prob.**
  ~ 72 % ($\Delta B_{\Lambda\Lambda} = 4.9$ *MeV*), 49 % ($\Delta B_{\Lambda\Lambda} = 1.0$ *MeV*)
- **Main products($\Delta B_{\Lambda\Lambda} = 1.0$ *MeV*)**
  $^{11}_{\Lambda\Lambda}Be$ (15 %), $^{10}_{\Lambda\Lambda}Be$ (16 %), $^{12}_{\Lambda\Lambda}B$ (6 %), $^{6}_{\Lambda\Lambda}He$ (1.8 %)



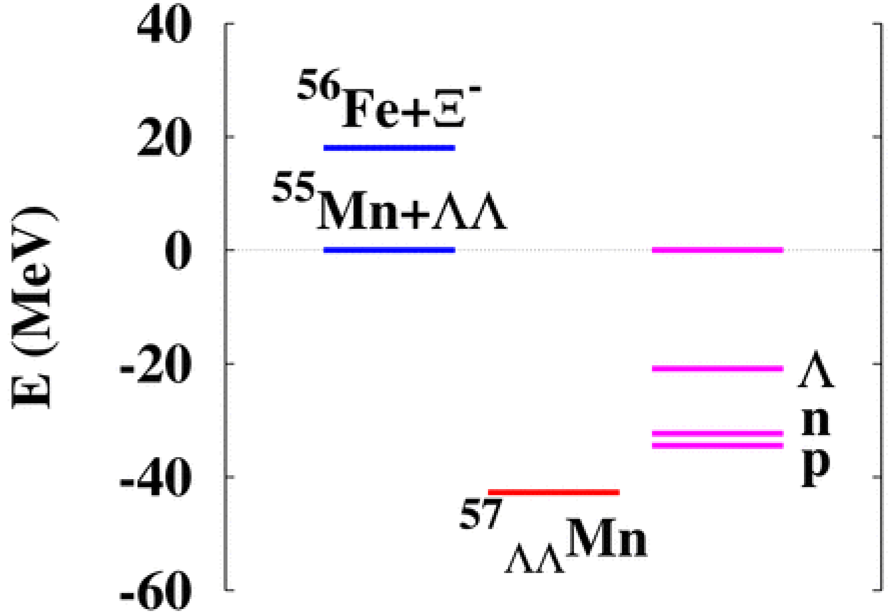


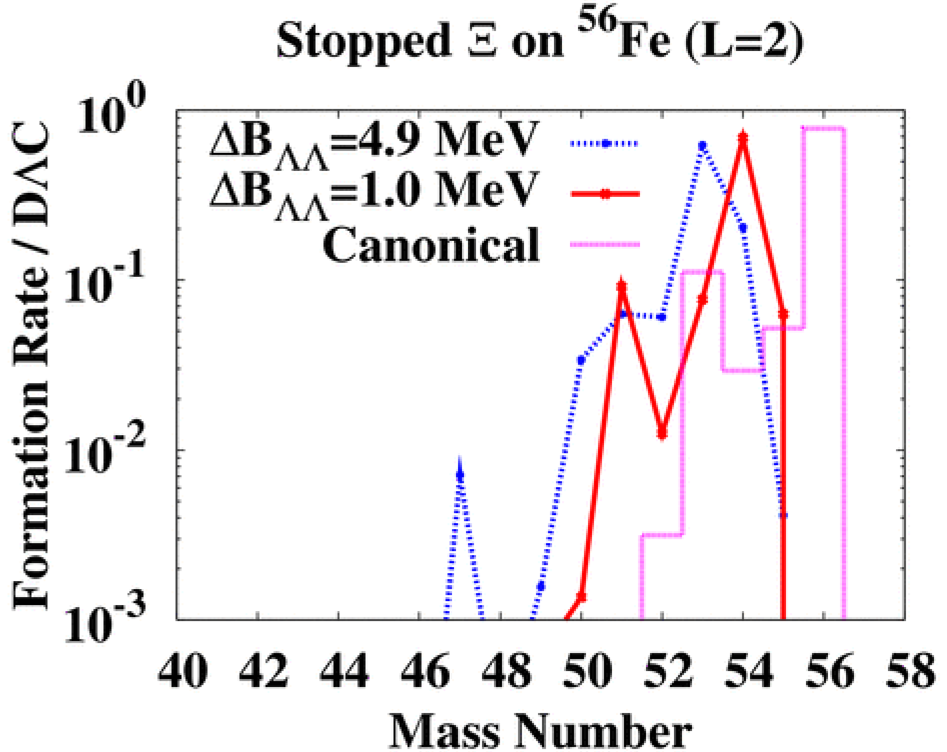
Stopped Ξ^- on ^{12}C

- **Our Previous Estimate**
  → **Mass Table based on old data, $\Delta B_{\Lambda\Lambda}$ ~ 4.9 MeV**
  - **DΛC form. prob. ~ 30 % (AMD), 16 % (AMD-QL)**
  - **DΛHN ($^6_{\Lambda\Lambda}$He) form. prob.**
    ~ 18 (2.7) % (AMD+Casc), 11 (1.9) % (AMD-QL+Casc.)
- **Present Estimate**
  → **Mass Table based on new data (Nagara), $\Delta B_{\Lambda\Lambda}$ ~ 1.0 MeV**
  - **DΛHN ($^6_{\Lambda\Lambda}$He) *survival* prob. ~ 49 (1.8) %**
  - **DΛHN ($^6_{\Lambda\Lambda}$He) *formation* prob.**
    ~ (DΛC form. ~ 30 %) × (DΛHN surv. prob.) ~ 15 (0.5) %
    → Explains why we cannot observe $^6_{\Lambda\Lambda}$He frequently !
    (E176, E373)

Stopped Ξ^- on ^{56}Fe

- DΛC formation prob. ~ (5-30) % ?
- Double Λ hyp. nucl. survival prob.
  ~ 99 % ($\Delta B_{\Lambda\Lambda}$ = 4.9 MeV), 93 % ($\Delta B_{\Lambda\Lambda}$ = 1.0 MeV)
- Main products
  $^{54}_{\Lambda\Lambda}Mn$ (3n emission, 52 %), $^{54}_{\Lambda\Lambda}Cr$ (p2n emission, 16 %)





Stopped Ξ^- on ^{56}Fe

- **Why do we have high DΛHN survival prob. ?**
  - **Total Excitation E ~ 60 MeV → E*/A ~ 1 MeV**
  - **$E^*/A = T^2/8$ → T ~ 3 MeV**
  - **S_p ~ 8 MeV, S_n ~ 10 MeV, S_Λ ~ 22 MeV**
    Emission prob. ~ exp(-S/T)
    → One Λ emission / One n emission ~ 1.4 %

Summary

- ***Structure study of Ξ hypernuclei in ccAMD***
  - **Coupled Channel AMD is also applicable to NKbar-Yπ and Nπ/N coupling system.**
    c.f. AMD with neutral π coherent state, Isshiki,Naito,AO, 2005
  - **Core Isospin & Core/Ξ mass diff. & Coulomb pot. suppresses coupling of Ξ^- and Ξ^0 states.**
  - *To do: Effective number / Transition density / Multigauss AMD*
- ***Statistical model study of stopped Ξ^- reactions***
  - **Double Λ form. prob.**
    ~ (Double Λ comp. form.) × (Double Λ surv.) ~ (5-40 %) × (90 %)
  - **^{56}Fe target → $^{54}_{\Lambda\Lambda}$Mn will be abundantly formed.**
  - *To do: Estimate of L-dependent DΛC form. prob.*
- ***Ξ physics requires us to understand all of Production, Structure and Decay.***
